Release Information

Document history

Issue	Date	Confidentiality	Change
0000-01	28 June 2019	Confidential	First development release for r0p0
0000-02	31 October 2019	Confidential	Second development release for r0p0
0000-03	31 January 2020	Confidential	First early access release for r0p0
0001-04	30 April 2020	Confidential	First early access release for r0p1
0001-05	29 September 2020	Non-Confidential	Second early access release for r0p1
0001-06	13 November 2020	Non-Confidential	Third early access release for r0p1
0002-07	31 March 2022	Non-Confidential	First release for r0p2
0003-08	3 July 2023	Non-Confidential	First release for r0p3

Confidentiality Status

This document is Non-Confidential. The right to use, copy and disclose this document may be subject to license restrictions in accordance with the terms of the agreement entered into by Arm and the party that Arm delivered this document to.

Unrestricted Access is an Arm internal classification.

Product Status

The information in this document is Final, that is for a developed product.

Feedback

Arm welcomes feedback on this product and its documentation. To provide feedback on the product, create a ticket on <https://support.developer.arm.com>.

To provide feedback on the document, fill the following survey: <https://developer.arm.com/documentation-feedback-survey>.

Inclusive language commitment

Arm values inclusive communities. Arm recognizes that we and our industry have used language that can be offensive. Arm strives to lead the industry and create change.

This document includes language that can be offensive. We will replace this language in a future issue of this document.

To report offensive language in this document, email terms@arm.com.

Contents

1. Introduction.....	18
1.1 Product revision status.....	18
1.2 Intended audience.....	18
1.3 Conventions.....	18
1.4 Useful resources.....	20
2. Functional description.....	22
2.1 Introduction.....	22
2.1.1 About the core.....	22
2.1.2 Features.....	24
2.1.3 Split-Lock.....	25
2.1.4 Implementation options.....	26
2.1.5 Supported standards and specifications.....	27
2.1.6 Test features.....	28
2.1.7 Design tasks.....	28
2.1.8 Product revisions.....	29
2.2 Technical overview.....	29
2.2.1 Components.....	29
2.2.2 Interfaces.....	32
2.2.3 About system control.....	32
2.2.4 About the Generic Timer.....	33
2.3 Clocks, resets, and input synchronization.....	33
2.3.1 About clocks, resets, and input synchronization.....	33
2.3.2 Asynchronous interface.....	34
2.4 Power management.....	34
2.4.1 About power management.....	34
2.4.2 Voltage domains.....	35
2.4.3 Power domains.....	35
2.4.4 Architectural clock gating modes.....	37
2.4.5 Power control.....	39
2.4.6 Core power modes.....	40
2.4.7 Encoding for power modes.....	43

2.4.8 Power domain states for power modes.....	43
2.4.9 Core powerup and powerdown sequences.....	44
2.4.10 Debug over powerdown.....	45
2.5 Memory Management Unit.....	45
2.5.1 About the MMU.....	46
2.5.2 TLB organization.....	47
2.5.3 TLB match process.....	48
2.5.4 Translation table walks.....	49
2.5.5 MMU memory accesses.....	50
2.5.6 Specific behaviors on aborts and memory attributes.....	51
2.5.7 Page-based hardware attributes.....	53
2.6 L1 memory system.....	54
2.6.1 About the L1 memory system.....	54
2.6.2 Cache behavior.....	55
2.6.3 L1 instruction memory system.....	57
2.6.4 L1 data memory system.....	59
2.6.5 Data prefetching.....	61
2.6.6 Direct access to internal memory.....	62
2.7 L2 memory system.....	77
2.7.1 About the L2 memory system.....	77
2.7.2 About the L2 cache.....	77
2.7.3 Support for memory types.....	78
2.8 Reliability, Availability, and Serviceability.....	78
2.8.1 Cache ECC and parity.....	79
2.8.2 Cache protection behavior.....	79
2.8.3 Uncorrected errors and data poisoning.....	81
2.8.4 RAS error types.....	82
2.8.5 Error Synchronization Barrier.....	82
2.8.6 Error recording.....	83
2.8.7 Error injection.....	84
2.8.8 Cache-line lockout.....	85
2.9 Generic Interrupt Controller CPU interface.....	86
2.9.1 About the Generic Interrupt Controller CPU interface.....	86
2.9.2 Bypassing the CPU interface.....	87
2.10 Advanced SIMD and floating-point support.....	87
2.10.1 About the Advanced SIMD and floating-point support.....	87

2.10.2 Accessing the feature identification registers.....	88
2.11 Split-Lock feature.....	88
2.11.1 Implementing Split-Lock.....	88
3. Register descriptions.....	95
3.1 AArch32 system registers.....	95
3.1.1 AArch32 architectural system register summary.....	95
3.2 AArch64 system registers.....	96
3.2.1 AArch64 registers.....	96
3.2.2 AArch64 architectural system register summary.....	96
3.2.3 AArch64 implementation defined register summary.....	102
3.2.4 AArch64 registers by functional group.....	104
3.2.5 ACTLR_EL1, Auxiliary Control Register, EL1.....	110
3.2.6 ACTLR_EL2, Auxiliary Control Register, EL2.....	111
3.2.7 ACTLR_EL3, Auxiliary Control Register, EL3.....	113
3.2.8 AFSR0_EL1, Auxiliary Fault Status Register 0, EL1.....	116
3.2.9 AFSR0_EL2, Auxiliary Fault Status Register 0, EL2.....	117
3.2.10 AFSR0_EL3, Auxiliary Fault Status Register 0, EL3.....	117
3.2.11 AFSR1_EL1, Auxiliary Fault Status Register 1, EL1.....	118
3.2.12 AFSR1_EL2, Auxiliary Fault Status Register 1, EL2.....	119
3.2.13 AFSR1_EL3, Auxiliary Fault Status Register 1, EL3.....	120
3.2.14 AIDR_EL1, Auxiliary ID Register, EL1.....	121
3.2.15 AMAIR_EL1, Auxiliary Memory Attribute Indirection Register, EL1.....	122
3.2.16 AMAIR_EL2, Auxiliary Memory Attribute Indirection Register, EL2.....	122
3.2.17 AMAIR_EL3, Auxiliary Memory Attribute Indirection Register, EL3.....	123
3.2.18 APDAKeyHi_EL1, Pointer Authentication Key A for Data.....	124
3.2.19 APDAKeyLo_EL1, Pointer Authentication Key A for Data.....	125
3.2.20 APDBKeyHi_EL1, Pointer Authentication Key B for Data.....	126
3.2.21 APDBKeyLo_EL1, Pointer Authentication Key B for Data.....	127
3.2.22 APGAKeyHi_EL1, Pointer Authentication Key A for Code.....	129
3.2.23 APGAKeyLo_EL1, Pointer Authentication Key A for Code.....	130
3.2.24 APIAKeyHi_EL1, Pointer Authentication Key A for Instruction.....	131
3.2.25 APIAKeyLo_EL1, Pointer Authentication Key A for Instruction.....	132
3.2.26 APIBKeyHi_EL1, Pointer Authentication Key B for Instruction.....	134
3.2.27 APIBKeyLo_EL1, Pointer Authentication Key B for Instruction.....	135
3.2.28 ATCR_EL1, Auxiliary Translation Control Register, EL1.....	136

3.2.29 ATCR_EL2, Auxiliary Translation Control Register, EL2.....	139
3.2.30 ATCR_EL12, Alias to Auxiliary Translation Control Register EL1.....	141
3.2.31 ATCR_EL3, Auxiliary Translation Control Register, EL3.....	142
3.2.32 AVTCR_EL2, Auxiliary Virtualized Translation Control Register, EL2.....	144
3.2.33 CCSIDR_EL1, Cache Size ID Register, EL1.....	145
3.2.34 CLIDR_EL1, Cache Level ID Register, EL1.....	147
3.2.35 CPACR_EL1, Architectural Feature Access Control Register, EL1.....	149
3.2.36 CPTR_EL2, Architectural Feature Trap Register, EL2.....	150
3.2.37 CPTR_EL3, Architectural Feature Trap Register, EL3.....	151
3.2.38 CPUACTLR_EL1, CPU Auxiliary Control Register, EL1.....	152
3.2.39 CPUACTLR2_EL1, CPU Auxiliary Control Register 2, EL1.....	153
3.2.40 CPUACTLR3_EL1, CPU Auxiliary Control Register 3, EL1.....	155
3.2.41 CPUACTLR5_EL1, CPU Auxiliary Control Register 5, EL1.....	156
3.2.42 CPUACTLR6_EL1, CPU Auxiliary Control Register 6, EL1.....	158
3.2.43 CPUCLLCTLR_EL1, Cache Line Lockout Control Register, EL1.....	159
3.2.44 CPUCLO_EL1, CPU Cache Line Lockout Register, EL1.....	160
3.2.45 CPUCLL1_EL1, CPU Cache Line Lockout Register, EL1.....	161
3.2.46 CPUCFR_EL1, CPU Configuration Register, EL1.....	163
3.2.47 CPUECTLR_EL1, CPU Extended Control Register, EL1.....	164
3.2.48 CPUECTLR2_EL1, CPU Extended Control Register2, EL1.....	174
3.2.49 CPUPCR_EL3, CPU Private Control Register, EL3.....	176
3.2.50 CPUPFR_EL3, CPU Private Flag Register, EL3.....	177
3.2.51 CPUPMR_EL3, CPU Private Mask Register, EL3.....	178
3.2.52 CPUPMR2_EL3, CPU Private Mask Register 2, EL3.....	180
3.2.53 CPUPOR_EL3, CPU Private Operation Register, EL3.....	181
3.2.54 CPUPOR2_EL3, CPU Private Operation Register 2, EL3.....	183
3.2.55 CPUPPMCR_EL3, CPU Power Performance Management Configuration Register, EL3.....	184
3.2.56 CPUPSELR_EL3, CPU Private Selection Register, EL3.....	185
3.2.57 CPUPWRCTLR_EL1, Power Control Register, EL1.....	187
3.2.58 CSSELR_EL1, Cache Size Selection Register, EL1.....	189
3.2.59 CTR_EL0, Cache Type Register, EL0.....	190
3.2.60 DCZID_EL0, Data Cache Zero ID Register, EL0.....	192
3.2.61 DISR_EL1, Deferred Interrupt Status Register, EL1.....	193
3.2.62 ERRIDR_EL1, Error ID Register, EL1.....	195
3.2.63 ERRSELR_EL1, Error Record Select Register, EL1.....	196
3.2.64 ERXADDR_EL1, Selected Error Record Address Register, EL1.....	196

3.2.65 ERXCTLR_EL1, Selected Error Record Control Register, EL1.....	197
3.2.66 ERXFR_EL1, Selected Error Record Feature Register, EL1.....	197
3.2.67 ERXMISC0_EL1, Selected Error Record Miscellaneous Register 0, EL1.....	197
3.2.68 ERXMISC1_EL1, Selected Error Record Miscellaneous Register 1, EL1.....	197
3.2.69 ERXPFGCDN_EL1, Selected Error Pseudo Fault Generation Count Down Register, EL1....	198
3.2.70 ERXPFGCTL_EL1, Selected Error Pseudo Fault Generation Control Register, EL1.....	199
3.2.71 ERXPFGF_EL1, Selected Pseudo Fault Generation Feature Register, EL1.....	200
3.2.72 ERXSTATUS_EL1, Selected Error Record Primary Status Register, EL1.....	201
3.2.73 ESR_EL1, Exception Syndrome Register, EL1.....	202
3.2.74 ESR_EL2, Exception Syndrome Register, EL2.....	203
3.2.75 ESR_EL3, Exception Syndrome Register, EL3.....	204
3.2.76 HACR_EL2, Hyp Auxiliary Configuration Register, EL2.....	205
3.2.77 HCR_EL2, Hypervisor Configuration Register, EL2.....	206
3.2.78 ID_AA64AFR0_EL1, AArch64 Auxiliary Feature Register 0.....	209
3.2.79 ID_AA64AFR1_EL1, AArch64 Auxiliary Feature Register 1.....	209
3.2.80 ID_AA64DFR0_EL1, AArch64 Debug Feature Register 0, EL1.....	209
3.2.81 ID_AA64DFR1_EL1, AArch64 Debug Feature Register 1, EL1.....	210
3.2.82 ID_AA64ISAR0_EL1, AArch64 Instruction Set Attribute Register 0, EL1.....	211
3.2.83 ID_AA64ISAR1_EL1, AArch64 Instruction Set Attribute Register 1, EL1.....	213
3.2.84 ID_AA64MMFR0_EL1, AArch64 Memory Model Feature Register 0, EL1.....	214
3.2.85 ID_AA64MMFR1_EL1, AArch64 Memory Model Feature Register 1, EL1.....	216
3.2.86 ID_AA64MMFR2_EL1, AArch64 Memory Model Feature Register 2, EL1.....	218
3.2.87 ID_AA64PFR0_EL1, AArch64 Processor Feature Register 0, EL1.....	219
3.2.88 ID_AA64PFR1_EL1, AArch64 Processor Feature Register 1, EL1.....	221
3.2.89 ID_AFR0_EL1, AArch32 Auxiliary Feature Register 0, EL1.....	222
3.2.90 ID_DFR0_EL1, AArch32 Debug Feature Register 0, EL1.....	223
3.2.91 ID_ISAR0_EL1, AArch32 Instruction Set Attribute Register 0, EL1.....	225
3.2.92 ID_ISAR1_EL1, AArch32 Instruction Set Attribute Register 1, EL1.....	227
3.2.93 ID_ISAR2_EL1, AArch32 Instruction Set Attribute Register 2, EL1.....	229
3.2.94 ID_ISAR3_EL1, AArch32 Instruction Set Attribute Register 3, EL1.....	231
3.2.95 ID_ISAR4_EL1, AArch32 Instruction Set Attribute Register 4, EL1.....	233
3.2.96 ID_ISAR5_EL1, AArch32 Instruction Set Attribute Register 5, EL1.....	235
3.2.97 ID_ISAR6_EL1, AArch32 Instruction Set Attribute Register 6, EL1.....	237
3.2.98 ID_MMFR0_EL1, AArch32 Memory Model Feature Register 0, EL1.....	238
3.2.99 ID_MMFR1_EL1, AArch32 Memory Model Feature Register 1, EL1.....	240
3.2.100 ID_MMFR2_EL1, AArch32 Memory Model Feature Register 2, EL1.....	242

3.2.101 ID_MMFR3_EL1, AArch32 Memory Model Feature Register 3, EL1.....	244
3.2.102 ID_MMFR4_EL1, AArch32 Memory Model Feature Register 4, EL1.....	246
3.2.103 ID_PFR0_EL1, AArch32 Processor Feature Register 0, EL1.....	248
3.2.104 ID_PFR1_EL1, AArch32 Processor Feature Register 1, EL1.....	249
3.2.105 ID_PFR2_EL1, AArch32 Processor Feature Register 2, EL1.....	251
3.2.106 LORC_EL1, LORegion Control Register, EL1.....	252
3.2.107 LORID_EL1, LORegion ID Register, EL1.....	253
3.2.108 LORN_EL1, LORegion Number Register, EL1.....	254
3.2.109 MDCR_EL3, Monitor Debug Configuration Register, EL3.....	254
3.2.110 MIDR_EL1, Main ID Register, EL1.....	257
3.2.111 MPIDR_EL1, Multiprocessor Affinity Register, EL1.....	258
3.2.112 PAR_EL1, Physical Address Register, EL1.....	260
3.2.113 REVIDR_EL1, Revision ID Register, EL1.....	261
3.2.114 RMR_EL3, Reset Management Register.....	262
3.2.115 RVBAR_EL3, Reset Vector Base Address Register, EL3.....	263
3.2.116 SCTLR_EL1, System Control Register, EL1.....	263
3.2.117 SCTLR_EL2, System Control Register, EL2.....	266

3.2.126 TTBR1_EL2, Translation Table Base Register 1, EL2.....	281
3.2.127 VDISR_EL2, Virtual Deferred Interrupt Status Register, EL2.....	281
3.2.128 VDISR_EL2 at EL1.....	282
3.2.129 VESER_EL2, Virtual SError Exception Syndrome Register.....	282
3.2.130 VTCR_EL2, Virtualization Translation Control Register, EL2.....	283
3.2.131 VTTBR_EL2, Virtualization Translation Table Base Register, EL2.....	284
3.3 Error system registers.....	285
3.3.1 Error system register summary.....	285
3.3.2 ERROADDR, Error Record Address Register.....	286
3.3.3 ERROCTL, Error Record Control Register.....	287
3.3.4 ERROFR, Error Record Feature Register.....	289

3.3.5	ERRORMISC0, Error Record Miscellaneous Register 0.....	291
3.3.6	ERRORMISC1, Error Record Miscellaneous Register 1.....	297
3.3.7	ERR0PFGCDN, Error Pseudo Fault Generation Count Down Register.....	297
3.3.8	ERR0PFGCTL, Error Pseudo Fault Generation Control Register.....	298
3.3.9	ERR0PFGF, Error Pseudo Fault Generation Feature Register.....	302
3.3.10	ERR0STATUS, Error Record Primary Status Register.....	305
3.4	Generic Interrupt Controller registers.....	308
3.4.1	CPU interface registers.....	308
3.4.2	AArch64 physical GIC CPU interface system register summary.....	309
3.4.3	ICC_APOR0_EL1, Interrupt Controller Active Priorities Group 0 Register 0, EL1.....	309
3.4.4	ICC_AP1R0_EL1, Interrupt Controller Active Priorities Group 1 Register 0 EL1.....	310
3.4.5	ICC_BPR0_EL1, Interrupt Controller Binary Point Register 0, EL1.....	310
3.4.6	ICC_BPR1_EL1, Interrupt Controller Binary Point Register 1, EL1.....	311
3.4.7	ICC_CTLR_EL1, Interrupt Controller Control Register, EL1.....	312
3.4.8	ICC_CTLR_EL3, Interrupt Controller Control Register, EL3.....	314
3.4.9	ICC_SRE_EL1, Interrupt Controller System Register Enable Register, EL1.....	317
3.4.10	ICC_SRE_EL2, Interrupt Controller System Register Enable register, EL2.....	318
3.4.11	ICC_SRE_EL3, Interrupt Controller System Register Enable register, EL3.....	319
3.4.12	AArch64 virtual GIC CPU interface register summary.....	321
3.4.13	ICV_APOR0_EL1, Interrupt Controller Virtual Active Priorities Group 0 Register 0, EL1....	321
3.4.14	ICV_AP1R0_EL1, Interrupt Controller Virtual Active Priorities Group 1 Register 0, EL1....	322
3.4.15	ICV_BPR0_EL1, Interrupt Controller Virtual Binary Point Register 0, EL1.....	322
3.4.16	ICV_BPR1_EL1, Interrupt Controller Virtual Binary Point Register 1, EL1.....	323
3.4.17	ICV_CTLR_EL1, Interrupt Controller Virtual Control Register, EL1.....	324
3.4.18	AArch64 virtual interface control system register summary.....	326
3.4.19	ICH_APOR0_EL2, Interrupt Controller Hyp Active Priorities Group 0 Register 0, EL2.....	327
3.4.20	ICH_AP1R0_EL2, Interrupt Controller Hyp Active Priorities Group 1 Register 0, EL2.....	327
3.4.21	ICH_HCR_EL2, Interrupt Controller Hyp Control Register, EL2.....	328
3.4.22	ICH_VMCR_EL2, Interrupt Controller Virtual Machine Control Register, EL2.....	331
3.4.23	ICH_VTR_EL2, Interrupt Controller VGIC Type Register, EL2.....	333
3.5	Advanced SIMD and floating-point registers.....	334
3.5.1	AArch64 register summary.....	335
3.5.2	FPCR, Floating-point Control Register.....	335
3.5.3	FPSR, Floating-point Status Register.....	337
3.5.4	MVFR0_EL1, Media and VFP Feature Register 0, EL1.....	339
3.5.5	MVFR1_EL1, Media and VFP Feature Register 1, EL1.....	341

3.5.6 MVFR2_EL1, Media and VFP Feature Register 2, EL1.....	343
3.5.7 AArch32 register summary.....	344
3.5.8 FPSCR, Floating-Point Status and Control Register.....	345

4. Debug descriptions.....349

4.1 Debug.....	349
4.1.1 About debug methods.....	349
4.1.2 Debug register interfaces.....	350
4.1.3 Debug events.....	352
4.1.4 External debug interface.....	353
4.2 Performance Monitoring Unit.....	353
4.2.1 About the PMU.....	353
4.2.2 PMU functional description.....	354
4.2.3 PMU events.....	355
4.2.4 PMU interrupts.....	362
4.2.5 Exporting PMU events.....	363
4.3 Activity Monitor Unit.....	363
4.3.1 About the AMU.....	363
4.3.2 Accessing the activity monitors.....	363
4.3.3 AMU counters.....	364
4.3.4 AMU events.....	364
4.4 Embedded Trace Macrocell.....	365
4.4.1 About the ETM.....	365
4.4.2 ETM trace unit generation options and resources.....	365
4.4.3 ETM trace unit functional description.....	366
4.4.4 Resetting the ETM.....	368
4.4.5 Programming and reading ETM trace unit registers.....	368
4.4.6 ETM trace unit register interfaces.....	369
4.4.7 Interaction with the PMU and Debug.....	370
4.5 Statistical Profiling Extension.....	370
4.5.1 About the statistical profiling extension.....	370
4.5.2 SPE functional description.....	371
4.5.3 implementation defined features of SPE.....	372

5. Debug registers..... 373

5.1 AArch32 debug registers.....	373
5.1.1 AArch32 Debug register summary.....	373

5.2 AArch64 debug registers.....	373
5.2.1 AArch64 Debug register summary.....	373
5.2.2 DBGBCRn_EL1, Debug Breakpoint Control Registers, EL1.....	375

1. Introduction

1.1 Product revision status

The r_xp_y identifier indicates the revision status of the product described in this manual, for example, $r1p2$, where:

r_x	Identifies the major revision of the product, for example, $r1$.
p_y	Identifies the minor revision or modification status of the product, for example, $p2$.

1.2 Intended audience

This manual is for system designers, system integrators, and programmers who are designing or programming a *System on Chip* (SoC) that uses an Arm core.

1.3 Conventions

The following subsections describe conventions used in Arm documents.

Glossary

The Arm® Glossary is a list of terms used in Arm documentation, together with definitions for those terms. The Arm Glossary does not contain terms that are industry standard unless the Arm meaning differs from the generally accepted meaning.

See the Arm Glossary for more information: developer.arm.com/glossary.

Convention	Use
<i>italic</i>	Citations.
bold	Terms in descriptive lists, where appropriate.
monospace	Text that you can enter at the keyboard, such as commands, file and program names, and source code.
monospace <u>underline</u>	A permitted abbreviation for a command or option. You can enter the underlined text instead of the full command or option name.
<and>	Encloses replaceable terms for assembler syntax where they appear in code or code fragments. For example: <pre>MRC p15, 0, <Rd>, <CRn>, <CRm>, <Opcode_2></pre>

Convention	Use
SMALL CAPITALS	Terms that have specific technical meanings as defined in the <i>Arm® Glossary</i> . For example, IMPLEMENTATION DEFINED , IMPLEMENTATION SPECIFIC , UNKNOWN , and UNPREDICTABLE .

Recommendations. Not following these recommendations might lead to system failure or damage.

Requirements for the system. Not following these requirements might result in system failure or damage.

Requirements for the system. Not following these requirements will result in system failure or damage.

An important piece of information that needs your attention.

A useful tip that might make it easier, better or faster to perform a task.

A reminder of something important that relates to the information you are reading.

Timing diagrams

The following figure explains the components used in timing diagrams. Variations, when they occur, have clear labels. You must not assume any timing information that is not explicit in the diagrams.

Shaded bus and signal areas are undefined, so the bus or signal can assume any value within the shaded area at that time. The actual level is unimportant and does not affect normal operation.

Figure 1-1: Key to timing diagram conventions

Signals

The signal conventions are:

Signal level

The level of an asserted signal depends on whether the signal is active-HIGH or active-LOW. Asserted means:

- HIGH for active-HIGH signals.
- LOW for active-LOW signals.

Lowercase n

At the start or end of a signal name, n denotes an active-LOW signal.

1.4 Useful resources

This document contains information that is specific to this product. See the following resources for other useful information.

Access to Arm documents depends on their confidentiality:

- Non-Confidential documents are available at developer.arm.com/documentation. Each document link in the following tables goes to the online version of the document.
- Confidential documents are available to licensees only through the product package.

2. Functional description

This part describes the main functionality of the Cortex®-A78AE core.

2.1 Introduction

This chapter provides an overview of the Cortex®-A78AE core and its features.

2.1.1 About the core

The Cortex®-A78AE core is a high-performance and low-power Arm product that implements the Arm®v8-A architecture inside the *DynamlQ Shared Unit AE* (DSU-AE) cluster.

The Cortex®-A78AE core supports three DSU-AE execution modes:

- Split-mode, where the cores in each core pair operate independently of each other.
- Lock-mode, where one of the cores in a core pair functions as a redundant copy of the primary function core.
- Hybrid-mode, where the cores operate independently, as in Split-mode, while the DSU-AE operates in lock-step, as in Lock-mode.

When running in Lock-mode, a *core pair* is defined as a pair of cores that are viewed architecturally by the DSU-AE as a single core. For more information on the DSU-AE and running in Split-mode, Lockmode, or Hybrid-mode, see *Functional description* in the *Arm® DynamlQ™ Shared Unit AE Technical Reference Manual*.

The Cortex®-A78AE core supports:

- The Arm®v8.2-A extension
- The *Reliability, Availability, and Serviceability* (RAS) extension
- The *Statistical Profiling Extension* (SPE)
- The Load acquire (LDAR) instructions introduced in the Arm®v8.3-A extension
- The Dot Product support instructions introduced in the Arm®v8.4-A extension
- The traps for ELO and EL1 cache controls, PSTATE *Speculative Store Bypass Safe* (SSBS) bit and the speculation barriers (CSDB, SSBB, PSSBB) instructions introduced in the Arm®v8.5-A extension
- The Pointer Authentication introduced in the Arm®v8.3-A extension
- The Enhanced Pointer Authentication, excluding the optional *Faulting Pointer Authentication Code* (FPAC) extension, introduced in the Arm®v8.6-Aextension
- The multi-OS support introduced in the Arm®v8.4-A extension

The Cortex®-A78AE core has a L1 memory system and a private integrated L2 cache. It also includes a superscalar, variable-length, out-of-order pipeline.

The Cortex®-A78AE core cannot be instantiated as a single core. The Cortex®-A78AE core must be used in a core pair configuration with a maximum of two core pairs in each cluster for a total of four cores.

The following figure shows an example of two Cortex®-A78AE core pairs in Lock-mode.

Figure 2-1: Example Cortex®-A78AE Lock-mode configuration

The following figure shows an example of four Cortex®-A78AE cores in Split-mode.

Figure 2-2: Example Cortex®-A78AE Split-mode configuration

For more information, see the *Arm® Cortex®-A78AE Core Technical Reference Manual*.

2.1.2 Features

The features of the Cortex®-A78AE core are categorized as core, cache, or debug features.

Core features

- Full implementation of the Arm®v8.2-A A64, A32, and T32 instruction sets
- Arm®v8.4-A Dot Product support instruction
- AArch32 Execution state at Exception level EL0 only. AArch64 Execution state at all Exception levels (EL0 to EL3)
- Support for Arm TrustZone® technology
- *A Memory Management Unit* (MMU)
- Superscalar, variable-length, out-of-order pipeline
- 48-bit *Physical Address* (PA)
- An integrated execution unit that implements the Advanced SIMD and floating-point architecture support
- Optional Cryptographic Extension
- *Generic Interrupt Controller* (GICv4) CPU interface to connect to an external distributor
- Generic Timers interface supporting 64-bit count input from an external system counter
- *Reliability, Availability, and Serviceability* (RAS) Extension
- Support for *Page-Based Hardware Attributes* (PBHA)
- Implementation of the Split, Lock, or Hybrid mode with the ability to choose a mode based on the *DynamiQ Shared Unit AE* (DSU-AE) `CEMODE` input signal during cluster cold reset
- Arm®v8.3-A Pointer Authentication support
- Arm®v8.6-A Enhanced Pointer Authentication support, excluding the optional FPAC extension
- Arm®v8.4-A multi-OS support

Cache features

- Separate L1 data and instruction caches
- Private, unified data and instruction L2 cache
- L1 and L2 memory protection in the form of *Error Correcting Code* (ECC) or parity on all RAM instances which affect functionality

Debug features

- Armv8.2 debug logic
- *Performance Monitoring Unit* (PMU)
- *Embedded Trace Macrocell* (ETM) that supports instruction trace only

- *Statistical Profiling Extension* (SPE)
- *Optional CoreSight Embedded Logic Analyzer* (ELA)

See the [Arm® Architecture Reference Manual for A-profile architecture](#) for more information.

2.1.3 Split-Lock

The *DynamiQ Shared Unit AE* (DSU-AE) provides a boot-time option for the cluster to execute in either Split-mode, Lock-mode, or Mixed-mode.

The Split-mode, Lock-mode, and Mixed-mode extend the functionality of a typical *Dual-Core Lock-Step* (DCLS) system by changing its execution mode at reset. For instance, while some modes enable more logical cores, others provide core redundancy. The potential of core redundancy requires an even number of cores in the DSU-AE cluster.

The DSU-AE CEMODE input signal determines whether the cluster enters the Lock-mode, Split-mode, or Mixed-mode at reset.

In Split-mode, cores execute independently. The DCLS-related comparators, timeout detectors, and redundant DSU-AE logic are clock gated and idle. Each core has its own independent clock. As a result, each core can be powered down independently.

In Lock-mode, one of the cores in a core pair functions as a redundant copy of the primary function core. A core pair is defined as a pair of cores that are viewed architecturally as a single core when executing in Lock-mode. The same inputs drive both the primary logic and the redundant logic, and the redundant core executes in lock-step with the primary function core. Therefore, both cores in a core pair must be of identical configuration with the same microarchitecture and configuration parameters.

Furthermore, in Lock-mode, the DSU-AE cluster utilizes redundant logic to execute in lock-step with the primary logic. For this reason, the entire cluster is executing as a DCLS system. The primary logic drives the outputs to the system, although these outputs are compared with the redundant logic. Any divergence is reported to the system. If a fault is detected, both of the cores are permitted to continue execution but the results are **UNPREDICTABLE**.

Mixed-mode is a mixed execution mode where the cores execute independently, as in Split-mode, while the DSU-AE executes in lock-step, as in Lock-mode. Therefore, in Mixed-mode, the DSU-AE cluster provides a partial DCLS solution with the following benefits:

- Compared to Lock-mode, Mixed-mode offers better cluster performance, since the cores execute independently of each other.
- Compared to Split-mode, Mixed-mode offers better cluster fault tolerance, since the DSU-AE executes in lock-step.

From a system or software perspective, there is no difference between the Split-mode and Mixed-mode.

For more information on Split-mode, Lock-mode, and Mixed-mode, see *Functional description* in the *Arm® DynamIQ™ Shared Unit AE Technical Reference Manual*.

2.1.4 Implementation options

All Cortex®-A78AE cores in the cluster must have the same configuration parameters, but each core can have a different L2 cache size.

The following table lists the implementation options for a core.

Table 2-1: Core implementation options

Feature	Range of options	Notes
L1 data cache size	<ul style="list-style-type: none"> 32KB 64KB 	-
L1 instruction cache size	<ul style="list-style-type: none"> 32KB 64KB 	-
L2 cache size	<ul style="list-style-type: none"> 256KB 512KB 	-
L2 transaction queue size	<ul style="list-style-type: none"> 48 entries 56 entries 62 entries 	There are two identical L2 banks in the Cortex®-A78AE core that can be configured with 24, 28 or 31 L2 transaction queue entries per L2 bank.
L1 and L2 ECC or parity protection	Included and enabled	L3 cache error protection must be enabled.
Cryptographic Extension	Can be included or not included	The Cryptographic Extension is a separately licensable product.
Core bus width	128-bit, 256-bit	<p>This specifies the bus width between the core and the DSU-AE CPU bridge. The legal core bus width and master bus width combinations are:</p> <ul style="list-style-type: none"> If the core bus width is 128 bits, the master bus interface can be any of the following options. <ul style="list-style-type: none"> Single 128-bit wide ACE interface Dual 128-bit wide ACE interfaces Single 128-bit wide CHI interface Single 256-bit wide CHI interface Dual 256-bit wide CHI interface If the core bus width is 256 bits, the master bus interface is a single or dual 256-bit wide CHI interface.

Feature	Range of options	Notes
CoreSight Embedded Logic Analyzer (ELA)	Optional support	Support for integrating CoreSight ELA-500. CoreSight ELA-500 is a separately licensable product.
ELA RAM Address size	See the Arm® CoreSight™ ELA-500 Embedded Logic Analyzer Technical Reference Manual for the full supported range.	-

Cache indices are determined such that the physical address and set number may not be directly correlated. A software flush using set and way operations that walk the entire space will work. Targeted operations that assume a relationship between the physical address and set number cannot be used. This is compliant with the Arm®v8-A architecture.

2.1.5 Supported standards and specifications

The Cortex®-A78AE core implements the Arm®v8-A architecture and some architecture extensions. It also supports interconnect, interrupt, timer, debug, and trace architectures.

Table 2-2: Compliance with standards and specifications

Architecture specification or standard	Version	Notes
Arm architecture	Arm®v8-A	<ul style="list-style-type: none"> AArch32 execution state at Exception level EL0 only AArch64 execution state at all Exception levels (EL0-EL3) A64, A32, and T32 instruction sets

2.1.6 Test features

The Cortex®-A78AE core provides test signals that enable the use of both *Automatic Test Pattern Generation* (ATPG) and *Memory Built-In Self Test* (MBIST) to test the core processing logic and memory arrays.

For more information, see *DFT integration guidelines* in the *Arm® Cortex®-A78AE Core Configuration and Integration Manual*.

2.1.7 Design tasks

The Cortex®-A78AE core is delivered as a synthesizable *Register Transfer Level* (RTL) description in Verilog HDL. Before you can use the Cortex®-A78AE core, you must implement it, integrate it, and program it.

A different party can perform each of the following tasks. Each task can include implementation and integration choices that affect the behavior and features of the core.

Implementation

The implementer configures and synthesizes the RTL to produce a hard macrocell. This task includes integrating RAMs into the design.

Integration

The integrator connects the macrocell into an SoC. This task includes connecting it to a memory system and peripherals.

Programming

In the final task, the system programmer develops the software to configure and initialize the core and tests the application software.

The operation of the final device depends on the following:

Build configuration

The implementer chooses the options that affect how the RTL source files are pre-processed. These options usually include or exclude logic that affects one or more of the area, maximum frequency, and features of the resulting macrocell.

Configuration inputs

The integrator configures some features of the core by tying inputs to specific values. These configuration settings affect the start-up behavior before any software configuration is made. They can also limit the options available to the software.

Software configuration

The programmer configures the core by programming particular values into registers. The configuration choices affect the behavior of the core.

2.1.8 Product revisions

This section indicates the first release and, in subsequent releases, describes the differences in functionality between product revisions.

r0p0	First release. For more information on the differences between development releases, see B.1 Revisions on page 544
r0p1	Bug fixes only. No features added from previous release.
r0p2	Bug fixes only. No features added from previous release.
r0p3	Bug fixes only. No features added from previous release.

2.2 Technical overview

This chapter describes the structure of the Cortex®-A78AE core.

2.2.1 Components

In a standalone configuration, there can be up to four Cortex®-A78AE cores and a *DynamiQ Shared Unit AE* (DSU-AE) that connects the cores to an external memory system.

For more information about the DSU-AE components, see *Components* in the *Arm® DynamiQ™ Shared Unit AE Technical Reference Manual*.

The main components of the Cortex®-A78AE core are:

- Instruction fetch
- Instruction decode
- Register rename
- Instruction issue
- Execution pipelines
- L1 data memory system
- L2 memory system

The following figure includes a top-level functional diagram of a core pair in Split-mode. In Lock-mode, Core 1 is named Core 0.

Figure 2-3: Cortex®-A78AE core overview

* Optional

There are multiple asynchronous bridges between the Cortex®-A78AE core and the DSU-AE. Only the coherent interface between the Cortex®-A78AE core and the DSU-AE can be configured to run synchronously, however it does not affect the other interfaces such as debug, trace, and *Generic Interrupt Controller (GIC)* which are always asynchronous. For more information on how to set the coherent interface to run either synchronously or asynchronously, see *Configuration Guidelines* in the *Arm® DynamIQ™ Shared Unit AE Configuration and Sign-off Guide*.

[Embedded Trace Macrocell](#) on page 365

2.2.1.1 Instruction fetch

The instruction fetch unit fetches instructions from the L1 instruction cache and delivers the instruction stream to the instruction decode unit.

The instruction fetch unit includes:

- A 4-way, set associative L1 instruction cache with 64-byte cache lines and parity protection. The L1 instruction cache is configurable with sizes of 32KB or 64KB.
- A fully associative L1 instruction TLB with native support for 4KB, 16KB, 64KB, and 2MB page sizes.
- A 1.5K entry, 4-way skewed associative L0 Macro-OP (MOP) cache with parity, which contains decoded and optimized instructions for higher performance.
- A dynamic branch predictor.

2.2.1.2 Instruction decode

The instruction decode unit supports the A32, T32, and A64 instruction sets. It also supports Advanced SIMD and floating-point instructions in each instruction set.

2.2.1.3 Register rename

The register rename unit performs register renaming to facilitate out-of-order execution and dispatches decoded instructions to various issue queues.

2.2.1.4 Instruction issue

The instruction issue unit controls when the decoded instructions are dispatched to the execution pipelines. It includes issue queues for storing instruction pending dispatch to execution pipelines.

2.2.1.5 Execution pipeline

The execution pipeline includes:

- Integer execute unit that performs arithmetic and logical data processing operations.
- Vector execute unit that performs Advanced SIMD and floating-point operations. Optionally, it can execute the cryptographic instructions.

2.2.1.6 L1 data memory system

The L1 data memory system executes load and store instructions and encompasses the L1 data side memory system. It also services memory coherency requests.

The load/store unit includes:

- A 4-way, set associative L1 data cache with 64-byte cache lines and ECC protection per 32 bits. The L1 data cache is configurable with sizes of 32KB or 64KB.
- A fully associative L1 data TLB with native support for 4KB, 16KB, 64KB page sizes and 2MB, 512MB block sizes.

2.2.1.7 L2 memory system

The L2 memory system services L1 instruction and data cache misses in the Cortex®-A78AE core.

The L2 memory system includes:

- An 8-way set associative L2 cache with data *Error Correcting Code* (ECC) protection per 64 bits. The L2 cache is configurable with sizes of 256KB, or 512KB.
- An interface with the DSU-AE configurable at implementation time for synchronous or asynchronous operation.

For direct accesses to the contents of the L2 RAMs where the index and way is specified for set and way operations, the mechanism to compute the cache indices from the physical address is shown in the following table.

Table 2-3: L2 RAM direct access size and index

L2 cache size	Physical address
256KB	addr[22:15] XOR addr[14:7]
512KB	addr[24:16] XOR addr[15:7]

2.2.2 Interfaces

The Cortex®-A78AE core has several interfaces to connect it to a *System on Chip* (SoC). The *DynamlQ Shared Unit AE* (DSU-AE) manages all interfaces.

For information on the interfaces, see *Technical overview* in the *Arm® DynamlQ™ Shared Unit AE Technical Reference Manual*.

2.2.3 About system control

The System registers control and provide status information for the functions that the core implements.

The main functions of the System registers are:

- Overall system control and configuration

- System performance monitoring
- Cache configuration and management
- *Memory Management Unit* (MMU) configuration and management
- *Generic Interrupt Controller* (GIC) configuration and management

The System registers are accessible in the AArch64 EL0-EL3 and AArch32 EL0 Execution state. Some of the System registers are accessible through the external debug interface.

2.2.4 About the Generic Timer

The Generic Timer can schedule events and trigger interrupts that are based on an incrementing counter value. It generates timer events as active-LOW interrupt outputs and event streams.

The Cortex®-A78AE core provides a set of timer registers. The timers are:

- An EL1 Non-secure physical timer
- An EL2 Hypervisor physical timer
- An EL3 Secure physical timer
- A virtual timer
- A Hypervisor virtual timer

The Cortex®-A78AE core does not include the system counter. This resides in the *System on Chip* (SoC). The system counter value is distributed to the core over a 64-bit bus.

For more information on the Generic Timer, see the *Arm® DynamIQ™ Shared Unit AE Technical Reference Manual* and the [Arm® Architecture Reference Manual for A-profile architecture](#).

2.3 Clocks, resets, and input synchronization

This chapter describes the clocks, resets, and input synchronization of the Cortex®-A78AE core.

2.3.1 About clocks, resets, and input synchronization

The Cortex®-A78AE core supports hierarchical clock gating.

The Cortex®-A78AE core contains several interfaces that connect to other components in the system. These interfaces can be in the same clock domain or in other clock domains.

For information about clocks, resets, and input synchronization, see *Functional description* in the *Arm® DynamIQ™ Shared Unit AE Technical Reference Manual*.

2.3.2 Asynchronous interface

Your implementation can include an optional asynchronous interface between the core and the *DynamlQ Shared Unit AE* (DSU-AE) top level.

See *Implementation options* in the *Arm® DynamlQ™ Shared Unit AE Technical Reference Manual* for more information.

2.4 Power management

This chapter describes the power domains and the power modes in the Cortex®-A78AE core.

2.4.1 About power management

The Cortex®-A78AE core provides mechanisms to control both dynamic and static power dissipation.

Dynamic power management includes the following features:

- Architectural clock gating
- Per-core *Dynamic Voltage and Frequency Scaling* (DVFS)

DVFS temporarily gates the source clock to lock a new frequency. If the source clock is gated too long, it can lead to a false divergence being reported in Lock-mode. In Lock-mode, DVFS is only safe and allowed when:

- The targeted clock domain is idle.
 - The core pair is either in retention mode or Off mode.
-

Static power management includes the following features:

- Dynamic retention
- Powerdown

Related information

[Power domain states for power modes](#) on page 43

[Power domains](#) on page 35

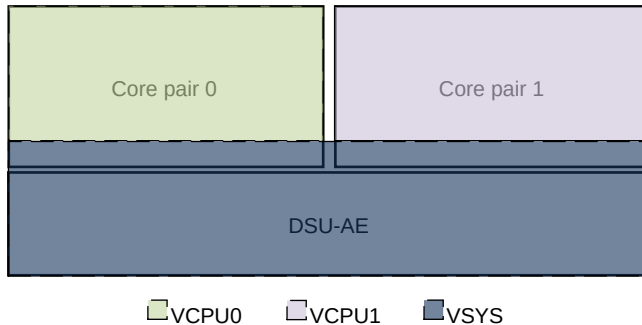

[Core powerup and powerdown sequences](#) on page 44

2.4.2 Voltage domains

The Cortex®-A78AE core supports a VCPU voltage domain and a VSYS voltage domain.

The following figure shows the VCPU and VSYS voltage domains in each Cortex®-A78AE core pair and in the *DynamIQ Shared Unit AE* (DSU-AE). The example shows a configuration with two Cortex®-A78AE core pairs, where each core pair is driven by the same voltage domain.

Figure 2-4: Cortex®-A78AE voltage domains

Asynchronous bridge logic exists between the voltage domains. The Cortex®-A78AE core processing logic and core clock domain of the asynchronous bridge are in the VCPU voltage domain. The DSU-AE clock domain of the asynchronous bridge is in the VSYS voltage domain.

You can tie VCPU and VSYS to the same supply if the core is not required to support *Dynamic Voltage and Frequency Scaling* (DVFS).

In Lock-mode, the core pair supports DVFS, and each core in a core pair has the same voltage domain and clock domain.

In Split-mode, each core in a core pair supports independent *Dynamic Frequency Scaling* (DFS), and each core in a core pair has a separate power domain. This separate power domain allows each core in a core pair to be powered down independently.

2.4.3 Power domains

The Cortex®-A78AE core contains a Core power domain (PDCPU) and a Core top-level SYS power domain (PDSYS) where all the Cortex®-A78AE core I/O signals go through.

PDCPU power domain

The PDCPU power domain contains all core processing logic excluding the cluster clock domain side of the bridge.

PDSYS power domain

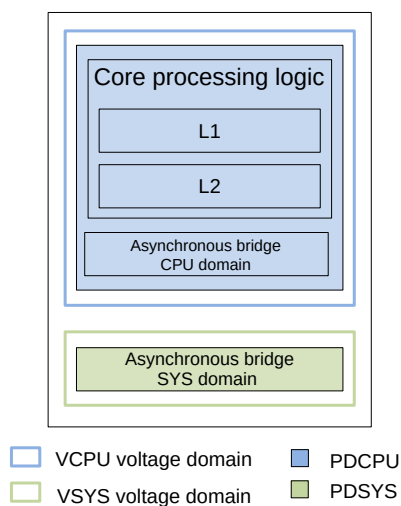

The PDSYS power domain contains the cluster clock domain side of the bridge.

There are additional system power domains in the DSU-AE. For more information on the DSU-AE system power domains, see the *Arm® DynamIQ™ Shared Unit AE Technical Reference Manual*.

The following figure shows an example of how the voltage and power domains are organized.

Figure 2-5: Cortex®-A78AE core power domain diagram

The following table shows the power domains that the Cortex®-A78AE core supports.

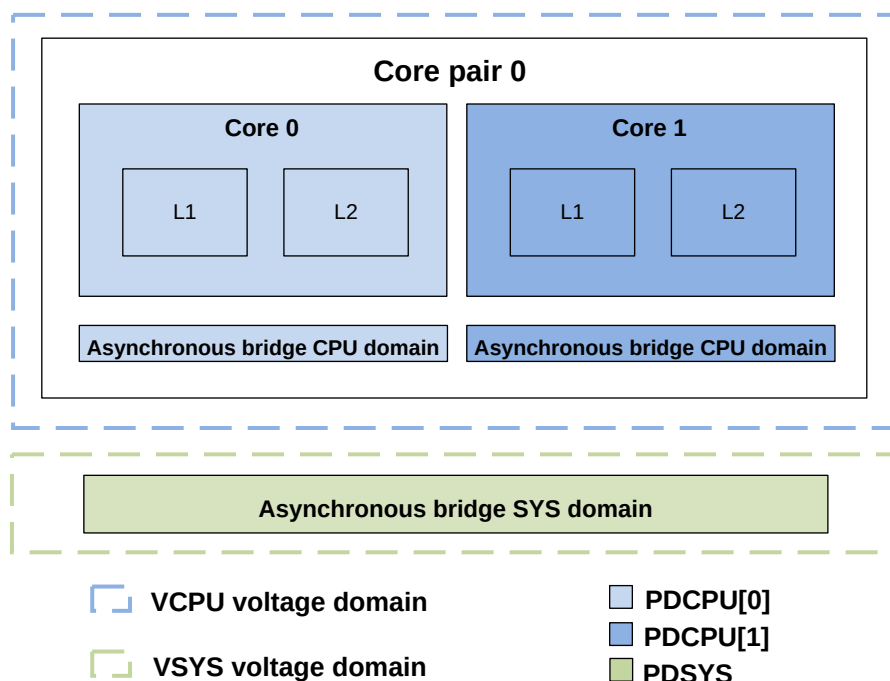

Table 2-4: Power domain description

Power domain	Description
PDCPU<n>	<p>The domain includes the <code>herculesae_cpu</code> RTL block, part of the core asynchronous bridge that belongs to the VCPU domain, and the L1 and L2 RAMs.</p> <p><n> is the number of Cortex®-A78AE cores. The number represents core 0, core 1, core 2, and core 3. If a core is not present, the corresponding power domain is not present.</p>
PDSYS	<p>The domain is the interface between the Cortex®-A78AE core and the DSU-AE. It contains the cluster clock domain logic of the CPU bridge. The CPU bridge contains all asynchronous bridges for crossing clock domains. The CPU bridge is split, with one half of each bridge in the core clock domain and the other half in the relevant cluster domain. All core I/O signals go through the CPU bridge and the SYS power domain.</p>

Clamping cells between power domains are inferred through power intent files rather than instantiated in the RTL.

The following figure shows the organization of the power domains for a single Cortex®-A78AE core pair. The colored boxes indicate the PDCPU and PDSYS power domains with respective voltage domains shown in dotted lines.

Figure 2-6: Cortex®-A78AE core power domains

For Lock-mode, the cores in this figure would be named Core 0 and Core 1.

For more information on power domains, see *Power management guidelines* in the *Arm® Cortex®-A78AE Core Configuration and Integration Manual*.

2.4.4 Architectural clock gating modes

When the Cortex®-A78AE core is in Standby mode, it is architecturally clock gated at the top of the clock tree.

Wait For Interrupt (WFI) and *Wait For Event* (WFE) are features of Arm®v8-A architecture that put the core in a low-power Standby mode by architecturally disabling the clock at the top of the clock tree. The core is fully powered and retains all the state in Standby mode.

2.4.4.1 Core Wait for Interrupt

Wait For Interrupt (WFI) uses a locking mechanism, based on events, to put the core in a low-power state by disabling most of the clocks in the core, while keeping the core powered up.

When the core executes the `WFI` instruction, the core waits for all instructions in the core, including explicit memory accesses, to retire before it enters a low-power state. The `WFI` instruction also ensures that store instructions have updated the cache or have been issued to the L3 memory system.

While the core is in WFI low-power state, the clocks in the core are temporarily enabled without causing the core to exit WFI low-power state when any of the following events are detected:

- A cluster snoop request that must be serviced by the core data caches
- A cache or *Translation Lookaside Buffer* (TLB) maintenance operation that must be serviced by the core L1 instruction cache, data cache, TLB, or L2 cache
- An *Advanced Peripheral Bus* (APB) access to the debug or trace registers residing in the Core power domain
- A *Generic Interrupt Controller* (GIC) CPU access through the AXI4-Stream channel

Exit from WFI low-power state occurs when the core detects one of the following:

- A reset
- One of the WFI wake up events

For more information, see the [Arm® Architecture Reference Manual for A-profile architecture](#).

2.4.4.2 Core Wait for Event

Wait For Event (WFE) uses a locking mechanism, based on events, to put the core in a low-power state by disabling most of the clocks in the core, while keeping the core powered up.

When the core executes the `WFE` instruction, the core waits for all instructions in the core, including explicit memory accesses, to retire before it enters a low-power state. The `WFE` instruction also ensures that store instructions have updated the cache or have been issued to the L3 memory system.

If the event register is set, execution of WFE does not cause entry into standby state, but clears the event register.

While the core is in WFE low-power state, the clocks in the core are temporarily enabled without causing the core to exit WFE low-power state when any of the following events are detected:

- A cluster snoop request that must be serviced by the core data caches
- A cache or *Translation Lookaside Buffer* (TLB) maintenance operation that must be serviced by the core L1 instruction cache, data cache, TLB, or L2 cache

- An *Advanced Peripheral Bus* (APB) access to the debug or trace registers residing in the Core power domain
- A GIC CPU access through the AXI4-Stream channel

Exit from WFE low-power state occurs when one of the following occurs:

- The core detects one of the WFE wake up events.
- The EVENTI input signal is asserted.
- The core detects a reset.

For more information, see the [Arm® Architecture Reference Manual for A-profile architecture](#).

2.4.5 Power control

All power mode transitions are performed at the request of the power controller, using a P-Channel interface to communicate with the Cortex®-A78AE core.

There is one P-Channel per core, plus one P-Channel for the cluster. The Cortex®-A78AE core provides the current requirements on the PACTIVE signals, so that the power controller can make decisions and request any change with PREQ and PSTATE. The Cortex®-A78AE core then performs any actions necessary to reach the requested power mode, such as gating clocks, flushing caches, or disabling coherency, before accepting the request.

If the request is not valid, either because of an incorrect transition or because the status has changed so that state is no longer appropriate, then the request is denied. The power mode of each core can be independent of other cores in the cluster, however the cluster power mode is linked to the mode of the cores.

2.4.6 Core power modes

The following figure shows the supported modes for each core domain P-Channel, and the transitions between them.

Figure 2-7: Cortex®-A78AE core power domain mode transitions

The blue modes indicate the modes the channel can be initialized into.

2.4.6.1 On mode

In this mode, the core is on and fully operational.

The core can be initialized into the On mode. If the core does not use P-Channel, you can tie the core in the On mode by tying PREQ LOW.

When a transition to the On mode completes, all caches are accessible and coherent. Other than the normal architectural steps to enable caches, no additional software configuration is required.

When the core domain P-Channel is initialized into the On mode, either as a shortcut for entering that mode or as a tie-off for an unused P-Channel, it is an assumed transition from the Off mode. This includes an invalidation of any cache RAM within the core domain.

2.4.6.2 Off mode

The Cortex®-A78AE core supports a full Shutdown mode where power can be removed completely and no state is retained.

The shutdown can be for either the whole cluster, for an individual core when in Split-mode, or for a core pair when in Lock-mode.

In this mode, all core processing logic and RAMs are off. The domain is inoperable and all core state is lost. The L1 and L2 caches are disabled, flushed and the core is removed from coherency automatically on transition to Off mode.

A Cold reset can reset the core in this mode.

The core P-Channel can be initialized into this mode.

An attempted debug access when the core domain is off returns an error response on the internal debug interface, indicating that the core is not available.

2.4.6.3 Emulated off mode

In this mode, all core domain logic and RAMs are kept on. However, core Warm reset can be asserted externally to emulate a power off scenario while keeping core debug state and allowing debug access.

All debug registers must retain their mode and be accessible from the external debug interface. All other functional interfaces behave as if the core were Off.

2.4.6.4 Core dynamic retention mode

In this mode, all core processing logic and RAMs are in retention and the core domain is inoperable. The core can be entered into this power mode when it is in *Wait For Interrupt* (WFI) or *Wait For Event* (WFE) mode.

For both Split-mode and Lock-mode, core dynamic retention must be enabled at the core pair level granularity.

The core dynamic retention can be enabled and disabled separately for WFI and WFE by software running on the core. Separate timeout values can be programmed for entry into this mode from WFI and WFE mode:

- Use the CPUPWRCTLR.WFI_RET_CTRL register bits to program timeout values for entry into core dynamic retention mode from WFI mode.
- Use the CPUPWRCTLR.WFE_RET_CTRL register bits to program timeout values for entry into core dynamic retention mode from WFE mode.

When in dynamic retention and the core is synchronous to the cluster, the clock to the core is automatically gated outside of the domain. However, if the core is running asynchronous to the

cluster, the system integrator must gate the clock externally during core dynamic retention. For more information, see the *Arm® DynamIQ™ Shared Unit AE Configuration and Sign-off Guide*.

The outputs of the domain must be isolated to prevent buffers without power from propagating **UNKNOWN** values to any operational parts of the system.

When the core is in dynamic retention there is support for snoop, *Generic Interrupt Controller* (GIC), and debug access, so the core appears as if it were in WFI or WFE mode. When such an incoming access occurs, it stalls and the On PACTIVE bit is set HIGH. The incoming access proceeds when the domain is returned to On using the P-Channel.

When the incoming access completes, and if the core has not exited WFI or WFE mode, then the On PACTIVE bit is set LOW after the programmed retention timeout. The power controller can then request to reenter the core dynamic retention mode.

2.4.6.5 Debug recovery mode

Debug recovery can be used to assist debug of external watchdog-triggered reset events.

It allows contents of the core L1 instruction, L1 data and L2 caches that were present before the reset to be observable after the reset. The contents of the caches are retained and are not altered on the transition back to the On mode.

By default, the core invalidates its caches when transitioning from Off to On mode. If the P-Channel is initialized to debug recovery, and the core is cycled through Cold or Warm reset along with system resets, then the cache invalidation is disabled. The cache contents are preserved when the core is transitioned to the On mode.

Debug recovery also supports preserving *Reliability, Availability, and Serviceability* (RAS) state, in addition to the cache contents. In this case, a transition to debug recovery is made from any of the current states. Once in Debug recovery mode, a cluster-wide Warm reset must be applied externally. The RAS and cache state are preserved when the core is transitioned to the On mode.

Debug recovery is strictly for debug purposes. It must not be used for functional purposes, as correct operation of the caches is not guaranteed when entering this mode.

- This mode can occur at any time with no guarantee of the state of the core. A P-Channel request of this type is accepted immediately, therefore its effects on the core, cluster, or the wider system are **UNPREDICTABLE**, and a wider system reset might be required. In particular, if there were outstanding memory system transactions at the time of the reset, then these might complete after the reset when the core is not expecting them and cause a system deadlock.
 - If the system sends a snoop to the cluster during this mode, then depending on the cluster state, the snoop might get a response and disturb the contents of the caches, or it might not get a response and cause a system deadlock.
-

2.4.7 Encoding for power modes

The following table shows the encodings for the supported modes for each core domain P-Channel.

Table 2-5: Core power modes COREPSTATE encoding

Power mode	Short name	PACTIVE bit number	PSTATE value	Power mode description
Core debug recovery mode	DEBUG_RECOV	-	0b001010	Logic is off (or in reset), RAM state is retained and not invalidated when transitioning to On mode.
On mode	ON	8	0b001000	All powerup
Core dynamic retention mode	FULL_RET	5	0b000101	Logic and RAM state are inoperable but retained.
Emulated off mode	OFF_EMU	1	0b000001	On with Warm reset asserted, Debug state is retained and accessible.
Off mode	OFF	0 (implicit) ¹	0b000000	All powerdown

You should disable and clear the interrupts of a core that is executing in lock-step in the *DynamicIQ Shared Unit* (DSU-AE) as part of the powerdown sequence; otherwise you can get false positive error reporting from the lock-step comparators.

2.4.8 Power domain states for power modes

The power domains can be controlled independently to give different combinations when powered-up and powered-down.

However, only some powered-up and powered-down domain combinations are valid and supported. The following information shows the supported power domain states for the Cortex®-A78AE core.

The PDCPU power domain supports the power states described in the following table.

Table 2-6: Power state description

Power state	Description
Off	Core off. Power to the block is gated.
Ret	Core retention. Logic and RAM retention power only.
On	Core on. Block is active.

¹ It is tied off to 0 and should be inferred when all other PACTIVE bits are LOW. For more information, see the [AMBA® Low Power Interface Specification](#).

States that are not shown in the following tables are unsupported and must not occur.

The following table describes the power modes, and the corresponding power domain states for individual cores. The power mode of each core is independent of all other cores in the cluster.

Table 2-7: Supported core power domain states

Power mode	Power domain state	Description
Debug recovery	On	Core on
On	On	Core on
Core dynamic retention	Ret	Core in retention
Off (emulated)	On	Core on
Off	Off	Core off

Deviating from the legal power modes can lead to **UNPREDICTABLE** results. You must comply with the dynamic power management and powerup and powerdown sequences described in the following sections.

2.4.9 Core powerup and powerdown sequences

The following approach allows taking the Cortex®-A78AE cores in the cluster in and out of coherence.

Core powerdown

To take a core out of coherence ready for core powerdown:

1. Save all architectural state
2. Disable all CPU interrupts, such as timer, and service any pending CPU interrupt
3. Configure the *Generic Interrupt Controller* (GIC) distributor to disable or reroute interrupts away from this core
4. Set the CPUPWRCTLR.CORE_PWRDN_EN bit to 1 to indicate to the power controller that a powerdown is requested
5. Execute an `ISB` instruction
6. Execute a `WFI` instruction

All L1 and L2 cache disabling, L1 and L2 cache flushing, and communication with the L3 memory system is performed in hardware after the `WFI` is executed, under the direction of the power controller.

- Emulated powerdown might generate a DCLS mismatch if debug activity is in progress during Warm reset, that is, during nCORERESET assertion.
- Executing any WFI instruction when the CPUPWRCTLR.CORE_PWRDN_EN bit is set automatically masks out all interrupts and wake up events in the core. If executed when the CPUPWRCTLR.CORE_PWRDN_EN bit is set the WFI never wakes up and the core needs to be reset to restart.

For information about cluster powerdown, see *Power management* in the *Arm® DynamIQ™ Shared Unit AE Technical Reference Manual*.

Core powerup

To bring a core into coherence after reset, no software steps are required.

Related information

[CPUPWRCTLR_EL1, Power Control Register, EL1](#) on page 186

2.4.10 Debug over powerdown

The Cortex®-A78AE core supports debug over powerdown, which allows a debugger to retain its connection with the core even when powered down. This enables debug to continue through powerdown scenarios, rather than having to re-establish a connection each time the core is powered up.

The debug over powerdown logic is part of the DebugBlock, which is external to the cluster and can be implemented in a separate power domain. If the DebugBlock is in the same power domain as the core, then debug over powerdown is not supported.

For more information on the DebugBlock, see *Debug* in the *Arm® DynamIQ™ Shared Unit AE Technical Reference Manual*.

In Lock-mode, debug over powerdown might generate a *Dual-Core Lock-Step* (DCLS) mismatch if debug activity is in progress during warm reset, that is, during nCORERESET assertion.

2.5 Memory Management Unit

This chapter describes the *Memory Management Unit* (MMU) of the Cortex®-A78AE core.

2.5.1 About the MMU

The *Memory Management Unit* (MMU) is responsible for translating addresses of code and data *Virtual Addresses* (VAs) to *Physical Addresses* (PAs) in the real system. The MMU also controls memory access permissions, memory ordering, and cache policies for each region of memory.

2.5.1.1 Main functions

The three main functions of the *Memory Management Unit* (MMU) are to:

- Control the table walk hardware that accesses translation tables in main memory
- Translate *Virtual Addresses* (VAs) to *Physical Addresses* (PAs)
- Provide fine-grained memory system control through a set of virtual-to-physical address mappings and memory attributes that are held in translation tables

Each stage of address translation uses a set of address translations and associated memory properties that are held in memory mapped tables called translation tables. Translation table entries can be cached into a *Translation Lookaside Buffer* (TLB).

The following table describes the components included in the MMU.

Table 2-8: TLBs and TLB caches in the MMU

Component	Description
Instruction L1 TLB	32 entries, fully associative
Data L1 TLB	32 entries, fully associative
L2 TLB cache	1024 entries, 4-way set associative
Translation table prefetcher	Detects access to contiguous translation tables and prefetches the next one. This prefetcher can be disabled in the ECTLR register.

The TLB entries contain either one or both of a global indicator and an *Address Space Identifier* (ASID) to permit context switches without requiring the TLB to be invalidated.

The TLB entries contain a *Virtual Machine Identifier* (VMID) to permit virtual machine switches by the hypervisor without requiring the TLB to be invalidated.

2.5.1.2 AArch64 behavior

The Cortex®-A78AE core is an Armv8 compliant core that supports execution in AArch64 state.

The following table shows the AArch64 behavior.

Table 2-9: AArch64 behavior

	AArch64
Address translation system	The Armv8 address translation system resembles an extension to the Long descriptor format address translation system to support the expanded virtual and physical address space.
Translation granule	4KB, 16KB, or 64KB for Armv8 AArch64 <i>Virtual Memory System Architecture</i> (VMSAv8-64). Using a larger granule size can reduce the maximum required number of levels of address lookup.
ASID size	8 or 16 bits depending on the value of TCR_ELx.AS.
VMID size	8 or 16 bits depending on the value of VTCR_EL2.VS.
PA size	Maximum 48 bits. Any configuration of TCR_ELx.IPS over 48 bits is considered as 48 bits. You can enable or disable each stage of the address translation independently.

The Cortex®-A78AE core also supports the *Virtualization Host Extension* (VHE) including ASID space for EL2. When VHE is implemented and enabled, EL2 has the same behavior as EL1.

See the [Arm® Architecture Reference Manual for A-profile architecture](#) for more information on concatenated translation tables and for address translation formats.

2.5.2 TLB organization

The *Translation Lookaside Buffer* (TLB) is a cache of recently executed page translations within the *Memory Management Unit* (MMU). The Cortex®-A78AE core implements a two-level TLB structure. The TLB stores all page sizes and is responsible for breaking these down in to smaller pages when required for the data or instruction L1 TLB.

2.5.2.1 Instruction L1 TLB

The instruction L1 TLB is implemented as a 32-entry fully associative structure. This TLB caches entries at the 4KB, 16KB, 64KB, and 2MB granularity of VA to PA mapping only.

A hit in the instruction L1 TLB provides a single CLK cycle access to the translation, and returns the PA to the instruction cache for comparison. It also checks the access permissions to signal an Instruction Abort.

2.5.2.2 Data L1 TLB

The data L1 TLB is a 32-entry fully associative TLB that is used by load and store operations. The cache entries have 4KB, 16KB, 64KB, 2MB, and 512MB granularity of VA to PA mappings only.

A hit in the data L1 TLB provides a single CLK cycle access to the translation, and returns the PA to the data cache for comparison. It also checks the access permissions to signal a Data Abort.

2.5.2.3 L2 TLB

The L2 TLB structure is shared by instruction and data. It handles misses from the instruction and data L1 TLBs.

The following table describes the L2 TLB characteristics.

Table 2-10: Characteristic of the L2 TLB

Characteristic	Note
4-way, set associative, 1024-entry cache	<p>Stores:</p> <ul style="list-style-type: none"> VA to PA mappings for 4KB, 16KB, 64KB, 2MB, 32MB, 512MB, and 1GB block sizes. <i>Intermediate physical address</i> (IPA) to PA mappings for 2MB and 1GB (in a 4KB translation granule), 32MB (in a 16K translation granule), and 512MB (in a 64K granule) block sizes. Only Non-secure EL1 and ELO stage 2 translations are cached. Intermediate PAs obtained during a translation table walk.

Access to the L2 TLB usually takes three cycles. If a different page or block size mapping is used, then this access can take longer.

The L2 TLB supports four translation table walks in parallel (four TLB misses), and can service two TLB lookups while the translation table walks are in progress. If there are six successive misses, the L2 TLB will stall.

Caches in the core are invalidated automatically at reset deassertion unless the core power mode is initialized to Debug recovery mode. See *Power management* in the *Arm® DynamIQ™ Shared Unit AE Technical Reference Manual* for more information.

2.5.3 TLB match process

The Armv8-A architecture provides support for multiple maps from the *Virtual Addresses* (VAs) space that are translated differently.

Translation Lookaside Buffer (TLB) entries store the context information required to facilitate a match and avoid the need for a TLB flush on a context or virtual machine switch.

Each TLB entry contains:

- VA
- Physical Addresses* (PAs)
- Set of memory properties that include type and access permissions

Each entry is either associated with a particular *Address Space Identifier* (ASID) or global. In addition, each TLB entry contains a field to store the *Virtual Machine Identifier* (VMID) in the entry applicable to accesses from Non-secure ELO and EL1 Exception levels.

Each entry is associated with a particular translation regime:

- EL3 in Secure state in AArch64 state only
- EL2 or EL0 in Non-secure state
- EL1 or EL0 in Secure state
- EL1 or EL0 in Non-secure state

A TLB match entry occurs when the following conditions are met:

- VA bits[48:N], where N is \log_2 of the block size for that translation that is stored in the TLB entry, matches the requested address.
- Entry translation regime matches the current translation regime.
- The ASID matches the current ASID held in the CONTEXTIDR, TTBR0, or TTBR1 register, or the entry is marked global.
- The VMID matches the current VMID held in the VTTBR_EL2 register.
- The ASID and VMID matches are **IGNORED** when ASID and VMID are not relevant. ASID is relevant when the translation regime is:
 - EL2 in Non-secure state with HCR_EL2.E2H and HCR_EL2.TGE set to 1
 - EL1 or EL0 in Secure state
 - EL1 or EL0 in Non-secure state

VMID is relevant for EL1 or EL0 in Non-secure state.

2.5.4 Translation table walks

When an access is requested at an address, the *Memory Management Unit* (MMU) searches for the requested *Virtual Address* (VA) in the *Translation Lookaside Buffers* (TLB). If it is not present, then it is a miss and the translation proceeds by looking up the translation table during a translation table walk.

When the Cortex®-A78AE core generates a memory access, the following process occurs:

1. The MMU performs a lookup for the requested VA, current *Address Space Identifier* (ASID), current *Virtual Machine Identifier* (VMID), and current translation regime in the relevant instruction or data L1 TLB.
2. If there is a miss in the relevant L1 TLB, the MMU performs a lookup for the requested VA, current ASID, current VMID, and translation regime in the L2 TLB.
3. If there is a miss in the L2 TLB, the MMU performs a hardware translation table walk.

In the case of a L2 TLB miss, the hardware does a translation table walk as long as the MMU is enabled, and the translation using the base register has not been disabled.

If the translation table walk is disabled for a particular base register, the core returns a Translation Fault. If the TLB finds a matching entry, it uses the information in the entry as follows.

The access permission bits determine if the access is permitted. If the matching entry does not pass the permission checks, the MMU signals a Permission fault. See the [Arm® Architecture Reference Manual for A-profile architecture](#) for details of Permission faults, including:

- A description of the various faults
- The fault codes
- Information regarding the registers where the fault codes are set

2.5.4.1 AArch64 behavior

When executing in AArch64 state at a particular Exception level, you can configure the hardware translation table walk to use either the 4KB, 16KB, or 64KB translation granule.

Program the Translation Granule bit, TGO, in the appropriate translation control register:

- TCR_EL1
- TCR_EL2
- TCR_EL3
- VTCR_EL2

For TCR_EL1, you can program the Translation Granule bits TGO and TG1 to configure the translation granule respectively for TTBR0_EL1 and TTBR1_EL1, or TCR_EL2 when *Virtualization Host Extension* (VHE) is enabled.

2.5.5 MMU memory accesses

During a translation table walk, the *Memory Management Unit* (MMU) generates accesses. This section describes the specific behaviors of the core for MMU memory accesses.

2.5.5.1 Configuring MMU accesses

By programming the IRGN and ORGN bit fields of the appropriate TCR_ELx registers, you can configure the *Memory Management Unit* (MMU) to perform translation table walks in cacheable or Non-cacheable regions.

If the encoding of both the ORGN and IRGN bit fields is Write-Back, the data cache lookup is performed and data is read from the data cache. External memory is accessed, if the ORGN and IRGN bit fields contain different attributes, or if the encoding of the ORGN and IRGN bit fields is Write-Through or Non-cacheable.

2.5.5.2 Descriptor hardware update

The core supports hardware update in AArch64 state using hardware management of the access flag and hardware management of dirty state.

These features are enabled in registers TCR_ELx and VTCR_EL2.

Hardware management of the Access flag is enabled by the following configuration fields:

- TCR_ELx.HA for stage 1 translations
- VTCR_EL2.HA for stage 2 translations

Hardware management of dirty state is enabled by the following configuration fields:

- TCR_ELx.HD for stage 1 translations
- VTCR_EL2.HD for stage 2 translations

Hardware management of dirty state can only be enabled if hardware management of the Access flag is enabled.

To support the hardware management of dirty state, the *Dirty Bit Modifier* (DBM) field is added to the translation table descriptors as part of Armv8.1 architecture.

The core supports hardware update only in outer Write-Back and inner Write-Back memory regions.

If software requests a hardware update in a memory region that is not inner Write-Back or not outer Write-Back, then the core returns an abort with the following encoding:

- ESR_ELx.DFSC = 0b110001 for Data Aborts in AArch64
- ESR_ELx.IFSC = 0b110001 for Instruction Aborts in AArch64

2.5.6 Specific behaviors on aborts and memory attributes

This section describes specific behaviors caused by aborts and also describes memory attributes.

MMU responses

When one of the following translations is completed, the *Memory Management Unit* (MMU) generates a response to the requester:

- A L1 TLB hit
- A L2 TLB hit
- A translation table walk

The response from the MMU contains the following information:

- The PA corresponding to the translation
- A set of permissions
- Secure or Non-secure
- All the information required to report aborts

For more information, see the [Arm® Architecture Reference Manual for A-profile architecture](#).

2.5.6.1 External aborts

External aborts are defined as those that occur in the memory system rather than those that the *Memory Management Unit* (MMU) detects. Normally, external memory aborts are rare. External aborts are caused by errors flagged to the external interface.

External aborts are reported synchronously when they occur during translation table walks, data access due to loads to Normal memory, loads with acquire semantics to Device memory and LD/CAS atomics. The address captured in the fault address register is that of the address that generated the synchronous External abort. External aborts are reported asynchronously when they occur for loads to Device memory, stores to any memory type, for cache maintenance, *Translation Lookaside Buffer* (TLB) invalidate, and instruction cache invalidate operations.

For more information, see the [Arm® Architecture Reference Manual for A-profile architecture](#).

2.5.6.2 Mis-programming contiguous hints

In the case of a mis-programming contiguous hint, when there is a descriptor that contains a set CH bit, all contiguous VAs contained in this block should be included in the input VA address space that is defined for stage 1 by TxSZ for TTBx or for stage 2 by {SLO, TOSZ}.

The Cortex®-A78AE core treats such a block as not causing a translation fault.

2.5.6.3 Conflict aborts

The Cortex®-A78AE core does not generate Conflict aborts.

When a TLB conflict is detected in the L1 TLB or L2 TLB, hardware automatically handles the conflict by invalidating the conflict entries.

2.5.6.4 Memory attributes

The memory region attributes specified in the TLB entry, or in the descriptor in case of translation table walk, determine if the access is:

- Normal Memory or Device type

- One of the four different device memory types that are defined for Armv8:

Device-nGnRnE

Device non-Gathering, non-Reordering, No Early Write Acknowledgement

Device-nGnRE

Device non-Gathering, non-Reordering, Early Write Acknowledgement

Device-nGRE

Device non-Gathering, Reordering, Early Write Acknowledgement

Device-GRE

Device Gathering, Reordering, Early Write Acknowledgment

In the Cortex®-A78AE core, a page is cacheable only if the inner memory attribute and outer memory attribute are write-back. In all other cases, all pages are downgraded to Non-cacheable Normal memory.

When the MMU is disabled at stage 1 and stage 2, and SCTLR.I is set to 1, instruction prefetches are cached in the instruction cache but not in the unified cache. In all other cases, normal behavior on memory attribute applies.

See the [Arm® Architecture Reference Manual for A-profile architecture](#) for more information on translation table formats.

2.5.7 Page-based hardware attributes

Page-Based Hardware Attributes (PBHA) is an optional, **IMPLEMENTATION DEFINED** feature.

It allows software to set up to two bits in the translation tables, which are then propagated through the memory system with transactions, and can be used in the system to control system components. The meaning of the bits is specific to the system design.

For information on how to set and enable the PBHA bits in the translation tables, see the [Arm® Architecture Reference Manual for A-profile architecture](#). When disabled, the PBHA value that is propagated on the bus is 0.

For memory accesses caused by a translation table walk, the AHTCR, ATTBCR, and AVTCR registers control the PBHA values.

PBHA combination between stage 1 and stage 2 on memory accesses

PBHA should always be considered as an attribute of the physical address.

When stage 1 and stage 2 are enabled:

- If both stage 1 PBHA and stage 2 PBHA are enabled, the final PBHA is stage 2 PBHA.
- If stage 1 PBHA is enabled and stage 2 PBHA is disabled, the final PBHA is stage 1 PBHA.
- If stage 1 PBHA is disabled and stage 2 PBHA is enabled, the final PBHA is stage 2 PBHA.
- If both stage 1 PBHA and stage 2 PBHA are disabled, the final PBHA is defined to 0.

Enable of PBHA has a granularity of one bit, so this property is applied independently on each PBHA bit.

Mismatched aliases

If the same physical address is accessed through more than one virtual address mapping, and the PBHA bits are different in the mappings, then the results are **UNPREDICTABLE**. The PBHA value sent on the bus could be for either mapping.

2.6 L1 memory system

This chapter describes the L1 instruction cache and data cache that make up the L1 memory system.

2.6.1 About the L1 memory system

The Cortex®-A78AE L1 memory system is designed to enhance core performance and save power.

The L1 memory system consists of separate instruction and data caches. Both are independently configurable to be either 32KB or 64KB.

2.6.1.1 L1 instruction-side memory system

The L1 instruction memory system has the following key features:

- *Virtually Indexed, Physically Tagged* (VIPT) 4-way set-associative L1 instruction cache, which behaves as a *Physically Indexed, Physically Tagged* (PIPT) cache
- Fixed cache line length of 64 bytes
- Pseudo-LRU cache replacement policy
- 256-bit read interface from the L2 memory system

The Cortex®-A78AE core also has a *Virtually Indexed, Virtually Tagged* (VIVT) 4-way skewed-associative, *Macro-OP* (MOP) cache, which behaves as a PIPT cache.

2.6.1.2 L1 data-side memory system

The L1 data memory system has the following features:

- *Virtually Indexed, Physically Tagged* (VIPT), which behaves as a *Physically Indexed, Physically Tagged* (PIPT) 4-way set-associative L1 data cache
- Fixed cache line length of 64 bytes
- Pseudo-LRU cache replacement policy

- 512-bit write interface from the L2 memory system
- 512-bit read interface from the L2 memory system
- Three 128-bit read paths from the data L1 memory system to the datapath
- 256-bit write path from the datapath to the L1 memory system

2.6.2 Cache behavior

The **IMPLEMENTATION SPECIFIC** features of the instruction and data caches include:

- At reset the instruction and data caches are disabled and both caches are automatically invalidated.

Note

Caches in the core are invalidated automatically at reset deassertion unless the core power mode is initialized to Debug recovery mode. For more information, see the *Power management* in the *Arm® DynamIQ™ Shared Unit AE Technical Reference Manual*.

- You can enable or disable each cache independently.
- Cache lockdown is not supported.
- On a cache miss, data for the cache linefill is requested in critical word-first order.

2.6.2.1 Instruction cache disabled behavior

If the instruction cache is disabled, fetches cannot access any of the instruction cache arrays. An exception is the instruction cache maintenance operations. If the instruction cache is disabled, the instruction cache maintenance operations can still execute normally.

If the instruction cache is disabled, all instruction fetches to cacheable memory are treated as if they were Non-cacheable. This treatment means that instruction fetches might not be coherent with caches in other cores, and software must take account of this.

2.6.2.2 Instruction cache speculative memory accesses

Instruction fetches are speculative. Execution is not guaranteed, because there can be several unresolved branches in the pipeline.

A branch instruction or exception in the code stream can cause a pipeline flush, discarding the currently fetched instructions. On instruction fetch accesses, pages with Device memory type attributes are treated as Non-Cacheable Normal Memory.

Device memory pages must be marked with the translation table descriptor attribute bit *Execute Never* (XN). The device and code address spaces must be separated in the physical memory map.

This separation prevents speculative fetches to read-sensitive devices when address translation is disabled.

If the instruction cache is enabled, and if the instruction fetches miss in the L1 instruction cache, they can still look up in the L1 data caches. However, a new line is not allocated in the data cache unless the data cache is enabled.

See the [Arm® Architecture Reference Manual for A-profile architecture](#) for more information.

2.6.2.3 Data cache disabled behavior

If the data cache is disabled, load and store instructions do not access any of the L1 data, L2 cache, and if present, the *DynamicIQ Shared Unit* (DSU-AE) L3 cache arrays.

Unless the data cache is enabled, a new line is not allocated in the L2 or L3 caches due to an instruction fetch.

Data cache maintenance operations are an exception. If the data cache is disabled, the data cache maintenance operations execute normally.

If the data cache is disabled, all loads and store instructions to cacheable memory are treated as if they were Non-cacheable. Therefore, they are not coherent with the caches in this core or the caches in other cores, and software must account for this possibility.

The L2 and L1 data caches cannot be disabled independently.

2.6.2.4 Data cache maintenance considerations

DCIMVAC operations in AArch32 state are treated as DCCIMVAC. DC IVAC operations in AArch64 state are treated as DC CIVAC except for permission checking and watchpoint matching.

In Non-secure state, DCISW operations in AArch32 state and DC ISW operations in AArch64 state, perform both a clean and invalidate of the target set/way. The values of HCR.SWIO and HCR_EL2.SWIO have no effect.

DC IMVAC operations in AArch32, and DC IVAC instructions in AArch64, perform an invalidate of the target address. If the data is dirty within the cluster, a clean is performed before the invalidate.

DC ISW operations in AArch32, and DC ISW instructions in AArch64, perform both a clean and invalidate of the target set/way. The values of HCR.SWIO and HCR_EL2.SWIO have no effect.

See the [Arm® Architecture Reference Manual for A-profile architecture](#) for more information.

2.6.2.5 Data cache coherency

To maintain data coherency between multiple cores, the Cortex®-A78AE core uses the *Modified Exclusive Shared Invalid* (MESI) protocol.

2.6.2.6 Write streaming mode

A cache line is allocated to the L1 on either a read miss or a write miss.

However, there are some situations where allocating on writes is not required. For example, when executing the C standard library `memset()` function to clear a large block of memory to a known value. Writes of large blocks of data can pollute the cache with unnecessary data. It can also waste power and performance if a linefill must be performed only to discard the linefill data because the entire line was subsequently written by the `memset()`.

To counter this, the L1 memory system includes logic to detect when the core has stores pending to a full cache line when it is waiting for a linefill to complete, or when it detects a `DCZVA` (full cache line write to zero). If this situation is detected, then it switches into write streaming mode.

When in write streaming mode, loads behave as normal, and can still cause linefills, and writes still lookup in the cache, but if they miss then they write out to L2 (or possibly L3, system cache, or DRAM) rather than starting a linefill.

The L1 memory system continues in write streaming mode until it can no longer create a full cacheline of stores (for example because of a lack of resource in the L1 memory system) or has detected a high proportion of stores hitting in the cache.

The L1 memory system is monitoring transaction traffic through L1 and, depending on different thresholds, can set a stream to go out to L2 cache, L3 cache, and system cache and DRAM.

The following register controls the different thresholds:

AArch64 state

CPUECTLR_EL1 configures the L2, L3, and system cache write streaming mode threshold. See [3.2.47 CPUECTLR_EL1, CPU Extended Control Register, EL1](#) on page 164.

2.6.3 L1 instruction memory system

The L1 instruction side memory system provides an instruction stream to the decoder.

It uses dynamic branch prediction and instruction caching to increase overall performance and to reduce power consumption.

2.6.3.1 Program flow prediction

The Cortex®-A78AE core contains program flow prediction hardware, also known as branch prediction.

Branch prediction increases overall performance and reduces power consumption. With program flow prediction disabled, all taken branches incur a penalty that is associated with flushing the pipeline.

To avoid this penalty, the branch prediction hardware predicts if a conditional or unconditional branch is to be taken. For conditional branches, the hardware predicts if the branch is to be taken. It also predicts the address that the branch goes to, known as the branch target address. For unconditional branches, only the target is predicted.

The hardware contains the following functionality:

- A *Branch Target Buffer* (BTB) holding the branch target address of previously taken branches
- A branch direction predictor using previous branch history
- The return stack, a stack of nested subroutine return addresses
- A static branch predictor
- An indirect branch predictor

Predicted and non-predicted instructions

Unless otherwise specified, the following list applies to A64, A32, and T32 instructions. As a rule the flow prediction hardware predicts all branch instructions regardless of the addressing mode, and includes:

- Conditional branches
- Unconditional branches
- Indirect branches that are associated with procedure call and return instructions
- Branches that switch between A32 and T32 states

Exception return instructions are not predicted.

T32 state conditional branches

A T32 unconditional branch instruction can be made conditional by inclusion in an *If-Then* (IT) block. It is then treated as a conditional branch.

Return stack

The return stack stores the address and instruction set state.

This address is equal to the link register value stored in R14 in AArch32 state or X30 in AArch64 state.

The following instructions cause a return stack push if predicted:

- `BL r14`

- BLX (immediate) in AArch32 state
- BLX (register) in AArch32 state
- BLR in AArch64 state
- MOV pc, r14

In AArch32 state, the following instructions cause a return stack pop if predicted:

- BX
- LDR pc, [r13], #imm
- LDM r13, {...pc}
- LDM r13, {...pc}

In AArch64 state, the RET instruction causes a return stack pop.

As exception return instructions can change core privilege mode and Security state, they are not predicted. These include ERET instruction.

2.6.4 L1 data memory system

The L1 data cache is organized as a 4-way *Virtually Indexed, Physically Tagged* (VIPT) cache.

Data cache invalidate on reset

The Armv8-A architecture does not support an operation to invalidate the entire data cache. If software requires this function, it must be constructed by iterating over the cache geometry and executing a series of individual invalidate by set/way instructions.

2.6.4.1 Memory system implementation

This section describes the implementation of the L1 memory system.

Limited ordering regions

The core offers support for four limited ordering region descriptors, as introduced by the Armv8.1 Limited ordering regions.

Atomic instructions

The Cortex®-A78AE core supports the atomic instructions added in Armv8.1 architecture.

Atomic instructions to cacheable memory can be performed as either near atomics or far atomics, depending on where the cache line containing the data resides.

When an instruction hits in the L1 data cache in a unique state, then it is performed as a near atomic in the L1 memory system. If the atomic operation misses in the L1 cache, or the line is shared with another core, then the atomic is sent as a far atomic on the core CHI interface.

If the operation misses everywhere within the cluster, and the interconnect supports far atomics, then the atomic is passed on to the interconnect to perform the operation.

When the operation hits anywhere inside the cluster, or when an interconnect does not support atomics, the L3 memory system performs the atomic operation. If the line is not already there, it allocates the line into the L3 cache. This depends on whether the DSU-AE is configured with an L3 cache.

Therefore, if software prefers that the atomic is performed as a near atomic, precede the atomic instruction with a `PLDW` or `PRFM PSTL1KEEP` instruction.

Alternatively, the CPUECTLR can be programmed such that different types of atomic instructions attempt to execute as a near atomic.

Finally, for load atomics, the CPUECTLR can be programmed such that these atomics will always be performed near, regardless of whether the line is original in the L1 memory system or not. One cache fill will be made on an atomic. If the cache line is lost before the atomic operation can be made, it will be sent as a far atomic.

The Cortex®-A78AE core supports atomics to device or Non-cacheable memory, however this relies on the interconnect also supporting atomics. If such an atomic instruction is executed when the interconnect does not support them, it will result in an abort.

For more information on the CPUECTLR register, see [3.2.47 CPUECTLR_EL1, CPU Extended Control Register, EL1](#) on page 164.

LDAPR instructions

The core supports Load acquire instructions adhering to the RCpc consistency semantic introduced in the Armv8.3 extensions for A profile. This is reflected in register `ID_AA64ISAR1_EL1` where bits[23:20] are set to `0b0001` to indicate that the core supports `LDAPRB`, `LDAPRH`, and `LDAPR` instructions implemented in AArch64.

Transient memory region

The core has a specific behavior for memory regions that are marked as write-back cacheable and transient, as defined in the Armv8.0 architecture.

For any load or store that is targeted at a memory region that is marked as transient, the following occurs:

- If the memory access misses in the L1 data cache, the returned cache line is allocated in the L1 data cache but is marked as transient.
- When the line is evicted from the L1 data cache, the transient hint is passed to the L2 cache so that the replacement policy will not attempt to retain the line. When the line is subsequently evicted from the L2 cache, it bypasses the next level cache entirely.

Non-temporal loads

Non-temporal loads indicate to the caches that the data is likely to be used for only short periods. For example, when streaming single-use read data that is then discarded. In addition to non-temporal loads, there are also Prefetch-Memory (**PRFM**) hint instructions with the **STRM** qualifier.

Non-temporal loads to memory that are designated as Write-Back are treated the same as loads to Transient memory.

2.6.4.2 Internal exclusive monitor

The Cortex®-A78AE core L1 memory system has an internal exclusive monitor.

This monitor is a 2-state, open and exclusive, state machine that manages Load-Exclusive or Store-Exclusive accesses and Clear-Exclusive (**CLREX**) instructions. You can use these instructions to construct semaphores, ensuring synchronization between different processes running on the core, and also between different cores that are using the same coherent memory locations for the semaphore. A Load-Exclusive instruction tags a small block of memory for exclusive access. **CTR.ERG** defines the size of the tagged block as 16 words, one cache line.

A load/store exclusive instruction is any one of the following:

- In the A64 instruction set, any instruction that has a mnemonic starting with **LDX**, **LDAX**, **STX**, or **STLX**.
- In the A32 and T32 instruction sets, any instruction that has a mnemonic starting with **LDREX**, **STREX**, **LDAEX**, or **STLEX**.

See the [Arm® Architecture Reference Manual for A-profile architecture](#) for more information about these instructions.

2.6.5 Data prefetching

This section describes the data prefetching behavior for the Cortex®-A78AE core.

Preload instructions

The Cortex®-A78AE core supports the AArch64 *Prefetch Memory* (**PRFM**) instructions and the AArch32 *Prefetch Data* (**PLD**) and *Preload Data With Intent To Write* (**PLDW**) instructions. These instructions signal to the memory system that memory accesses from a specified address are likely to occur soon. The memory system acts by taking actions that aim to reduce the latency of the memory access when they occur. **PRFM** instructions perform a lookup in the cache, and if they miss and are to a cacheable address, a linefill starts. However, the **PRFM** instruction retires when its linefill is started, rather than waiting for the linefill to complete. This enables other instructions to execute while the linefill continues in the background.

The *Preload Instruction* (PLI) memory system hint performs preloading in the L2 cache for cacheable accesses if they miss in both the L1 instruction cache and L2 cache. Instruction preloading is performed in the background.

For more information about prefetch memory and preloading caches, see the [Arm® Architecture Reference Manual for A-profile architecture](#).

Data prefetching and monitoring

The load-store unit includes a hardware prefetcher that is responsible for generating prefetches targeting both the L1 and the L2 cache. The load side prefetcher uses the virtual address to prefetch to both the L1 and L2 Cache. The store side prefetcher uses the physical address, and only prefetches to the L2 Cache.

The CPUECTLR register allows you to have some control over the prefetcher. See [3.2.47 CPUECTLR_EL1, CPU Extended Control Register, EL1](#) on page 164 for more information on the control of the prefetcher.

Use the prefetch memory system instructions for data prefetching where short sequences or irregular pattern fetches are required.

Data cache zero

The Armv8-A architecture introduces a *Data Cache Zero by Virtual Address* (DC ZVA) instruction.

In the Cortex®-A78AE core, this instruction enables a block of 64 bytes in memory, aligned to 64 bytes in size, to be set to zero.

For more information, see the [Arm® Architecture Reference Manual for A-profile architecture](#).

2.6.6 Direct access to internal memory

The Cortex®-A78AE core provides a mechanism to read the internal memory that is used by the L1 caches, L2 cache, and *Translation Lookaside Buffer* (TLB) structures through **IMPLEMENTATION DEFINED** System registers. This functionality can be useful when debugging software or hardware issues.

When the core executes in AArch64 state, there are six read-only registers that are used to access the contents of the internal memory. The internal memory is selected by programming the **IMPLEMENTATION DEFINED** RAMINDEX register (using SYS #6, c15, c0, #0 instruction). These operations are available only in EL3. In all other modes, executing these instructions results in an Undefined Instruction exception. The data is read from read-only registers as shown in the following table. After accessing the cache, a *Data Synchronization Barrier* (DSB) is required prior to reading the data register.

Table 2-11: AArch64 registers used to access internal memory

Register name	Function	Access	Operation	Rd Data
IDATA0_EL3	Instruction Register 0	Read-only	S3_6_c15_c0_0	Data
IDATA1_EL3	Instruction Register 1	Read-only	S3_6_c15_c0_1	Data

Register name	Function	Access	Operation	Rd Data
IDATA2_EL3	Instruction Register 2	Read-only	S3_6_c15_c0_2	Data
DDATA0_EL3	Data Register 0	Read-only	S3_6_c15_c1_0	Data
DDATA1_EL3	Data Register 1	Read-only	S3_6_c15_c1_1	Data
DDATA2_EL3	Data Register 2	Read-only	S3_6_c15_c1_2	Data

Debug reads of ECC protected structures (L1 data cache tag, L1 data cache data, L2 cache tag, L2 cache victim, and L2 cache data) do not return corrected data. That is, the data written to the DDATA0-3 registers is the unaltered RAM contents.

In order to guarantee that ECC errors that might occur when performing debug reads are not recorded and corrected, software should disable error detection by setting ERROCTLR_EL1.ED to 0.

2.6.6.1 Encoding for L1 instruction cache tag, L1 instruction cache data, L1 BTB, L1 GHB, L1 BIM, L1 TLB instruction, and L0 macro-op cache data

The following tables show the encoding required to select a given cache line.

Table 2-12: L1 instruction cache tag location encoding

2.6.6.2 Encoding for L1 data cache tag, L1 data cache data, and L1 TLB data

The core data cache consists of a 4-way set-associative structure.

The encoding, which is set in `rd` in the appropriate `mcrr` instruction, used to locate the required cache data entry for tag, data, and TLB memory is shown in the following tables. It is similar for both the tag RAM, data RAM, and TLB access. Data RAM access includes an additional field to locate the appropriate doubleword in the cache line.

Tag RAM encoding includes an additional field to select which one of the two cache channels must be used to perform any access.

Table 2-39: L1 data cache tag location encoding

Bit fields of <code>Rd</code>	Description

2.7 L2 memory system

This chapter describes the L2 memory system.

2.7.1 About the L2 memory system

The L2 memory subsystem consists of:

- An 8-way set associative L2 cache with a configurable size of 256KB or 512KB. Cache lines have a fixed length of 64 bytes.
- Strictly inclusive with L1 data cache. Weakly inclusive with L1 instruction cache.
- Configurable CHI interface to the *DynamicIQ Shared Unit* (DSU-AE) or CHI compliant system with support for 128-bit and 256-bit data widths.
- Dynamic biased replacement policy.
- *Modified Exclusive Shared Invalid* (MESI) coherency.
- In Lock-mode, L2 tag and data pipelines are forced to inline correction mode to allow single-bit ECC error correction without causing lock-step divergence.

2.7.2 About the L2 cache

The integrated L2 cache is the Point of Unification for the Cortex®-A78AE core. It handles both instruction and data requests from the instruction side and data side of each core respectively.

When fetched from the system, instructions are allocated to the L2 cache and can be invalidated during maintenance operations.

⁴ when bit [43] of Instruction register 1 is set, indicating that this is a walk cache entry, the decoding provided in this table is not valid.

Caches in the core are invalidated automatically at reset deassertion unless the core power mode is initialized to Debug recovery mode. See the *Power management* in the *Arm® DynamIQ™ Shared Unit AE Technical Reference Manual* for more information.

2.7.3 Support for memory types

The Cortex®-A78AE core simplifies the coherency logic by downgrading some memory types.

- Memory that is marked as both Inner Write-Back Cacheable and Outer Write-Back Cacheable is cached in the L1 data cache and the L2 cache.
- Memory that is marked Inner Write-Through is downgraded to Non-cacheable.
- Memory that is marked Outer Write-Through or Outer Non-cacheable is downgraded to Non-cacheable, even if the inner attributes are Write-Back cacheable.

The following table shows the transaction capabilities of the Cortex®-A78AE core. It lists the maximum possible values for read, write, DVM issuing, and snoop capabilities of the private L2 cache.

Table 2-71: Cortex®-A78AE transaction capabilities

Attribute	Value	Description
Write issuing capability	46/54/60	Maximum number of outstanding write transactions. Dependent on the configured TQ size. (48/56/62)
Read issuing capability	46/54/60	Maximum number of outstanding read transactions. Dependent on the configured TQ size. (48/56/62)
Snoop acceptance capability	29/33/36	Maximum number of outstanding snoops and stashes accepted. Dependent on the TQ size. (48/56/62)
DVM issuing capability	46/54/60	Maximum number of outstanding DVMOp transactions. Dependent on the configured TQ size. (48/56/62)

2.8 Reliability, Availability, and Serviceability

This chapter describes the *Reliability, Availability, and Serviceability* (RAS) features implemented in the Cortex®-A78AE core.

2.8.1 Cache ECC and parity

The Cortex®-A78AE core implements the *Reliability, Availability, Serviceability* (RAS) extension to the Arm®v8-A architecture which provides mechanisms for standardized reporting of the errors generated by cache protection mechanisms.

The Cortex®-A78AE core can detect and correct a 1-bit error in any RAM and detect 2-bit errors in some RAMs.

The RAS extension improves the system by reducing unplanned outages:

- Transient errors can be detected and corrected before they cause application or system failure.
- Failing components can be identified and replaced.
- Failure can be predicted ahead of time to allow replacement during planned maintenance.

Errors that are present but not detected are known as latent or undetected errors. A transaction carrying a latent error is corrupted. In a system with no error detection, all errors are latent errors and are silently propagated by components until either:

- They are masked and do not affect the outcome of the system. These are benign or false errors.
- They affect the service interface of the system and cause failure. These are silent data corruptions.

The severity of a failure can range from minor to catastrophic. In many systems, data or service loss is regarded as more of a minor failure than data corruption, as long as backup data is available.

The RAS extension focuses on errors that are produced from hardware faults, which fall into two main categories:

- Transient faults
- Persistent faults

The RAS extension describes data corruption faults, which mostly occur in memories and on data links. RAS concepts can also be used for the management of other types of physical faults found in systems, such as lock-step errors, thermal trip, and mechanical failure. The RAS extension provides a common programmers model and mechanisms for fault handling and error recovery.

2.8.2 Cache protection behavior

The configuration of the *Reliability, Availability, and Serviceability* (RAS) extension that is implemented in the Cortex®-A78AE core includes cache protection.

Cache protection ensures that the Cortex®-A78AE core is protected against errors that result in a RAM bitcell holding the incorrect value.

The RAMs in the Cortex®-A78AE core have the following types of cache protection:

SED

Single Error Detect. One bit of parity is applicable to the entire word. The word size is specific for each RAM and depends on the protection granule.

Interleaved parity

One bit of parity is applicable to the even bits of the word, and one bit of parity is applicable to the odd bits of the word.

SECEDED

Single Error Correct, Double Error Detect.

[Table 2-72: Cache protection behavior](#) on page 80 indicates which protection type is applied to each RAM.

The core can progress and remain functionally correct when there is a single bit error in any RAM.

If there are multiple single bit errors in different RAMs, or within different protection granules within the same RAM, then the core also remains functionally correct.

If there is a double bit error in a single RAM within the same protection granule, then the behavior depends on the RAM:

- For RAMs with SECEDED capability, the core detects and either reports or defers the error. If the error is in a cache line containing dirty data, then that data might be lost.
- For RAMs with only SED, the core does not detect a double bit error. This might cause data corruption.

If there are three or more bit errors within the same protection granule, then depending on the RAM and the position of the errors within the RAM, the core might or might not detect the errors.

The cache protection feature of the core has a minimal performance impact when no errors are present.

Table 2-72: Cache protection behavior

RAM	Protection type	Protection granule	Correction behavior
L0 macro-op cache	SED	48 bits	The line that contains the error is invalidated from the macro-op cache and fetched again from the L1 instruction cache.
L1 instruction cache tag	1 parity bit	31 bits	The line that contains the error is invalidated from the L1 instruction cache and fetched again from the subsequent memory system.
L1 instruction cache data	SED	72 bits	The line that contains the error is invalidated from the L1 instruction cache and fetched again from the subsequent memory system.
L1 BTB	None	-	-
L1 GHB	None	-	-
L1 BIM	None	-	-
L1 data cache tag	SECEDED	34 bits + 7 bits for ECC attached to the word.	The cache line that contains the error gets evicted, corrected in line, and refilled to the core.
L1 data cache data	SECEDED	32 bits of data + 1 poison bit + 7 bits for ECC attached to the word.	The cache line that contains the error gets evicted, corrected in line, and refilled to the core.

RAM	Protection type	Protection granule	Correction behavior
L1 Prefetch History Table (PHT)	None	-	-
MMU translation cache	2 interleaved parity bits	71 bits	Entry invalidated, new pagewalk started to refetch it.
MMU replacement policy	None	-	
L2 cache tag	SECEDED	256KB L2 - 7 ECC bits for 43 tag bits 512KB L2 - 7 ECC bits for 42 tag bits	Tag is corrected inline.
L2 cache data	SECEDED	8 ECC bits for 64 data bits	Data is corrected inline.
L2 victim	None	-	-
L2 TQ data	SECEDED	8 ECC bits for 64 data bits	Data is corrected inline.

To ensure that progress is guaranteed even in case of hard error, the core returns corrected data to the core, and no cache access is required after data correction.

2.8.3 Uncorrected errors and data poisoning

When an error is detected, the correction mechanism is triggered. However, if the error is a 2-bit error in a RAM protected by ECC, then the error is not correctable.

The behavior on an uncorrected error depends on the type of RAM.

Uncorrected error detected in a data RAM

When an uncorrected error is detected in a data RAM, the chunk of data with the error is marked as poisoned. This poison information is then transferred with the data and stored in the cache if the data is allocated into another cache. The poisoned information is stored per 64 bits of data, except in the L1 data cache where it is stored per 32 bits of data.

Uncorrected error detected in a tag RAM

When an uncorrected error is detected in a tag RAM, either the address or coherency state of the line is not known, and the corresponding data cannot be poisoned. In this case, the line is invalidated and an error recovery interrupt is generated to notify software that data has potentially been lost.

2.8.4 RAS error types

This section describes the *Reliability, Availability, Serviceability* (RAS) error types that are introduced by the RAS extension and supported in the Cortex®-A78AE core.

When a component accesses memory, an error might be detected in that memory and then be corrected, deferred, or detected but silently propagated. The following table lists the types of RAS errors that are supported in the Cortex®-A78AE core.

Table 2-73: RAS error types supported in the Cortex®-A78AE core

RAS error type	Definition
Corrected	A <i>Corrected Error</i> (CE) is reported for a single-bit ECC error on any protected RAM.
Deferred	A <i>Deferred Error</i> (DE) is reported for a double-bit ECC error that affects the data RAM on either the L1 data cache or the L2 cache.
Uncorrected	An <i>Uncorrected Error</i> (UE) is reported for a double-bit ECC error that affects the tag RAM of either the L1 data cache or the L2 cache. An Uncorrected Error is also reported for External aborts received in response to a store, data cache maintenance, instruction cache maintenance, TLBI maintenance, or cache copyback of dirty data.

2.8.5 Error Synchronization Barrier

The *Error Synchronization Barrier* (ESB) instruction synchronizes unrecoverable system errors.

In the Cortex®-A78AE core, the ESB instruction allows efficient isolation of errors:

- The ESB instruction does not wait for completion of accesses that cannot generate an asynchronous External abort. For example, if all External aborts are handled synchronously or it is known that no such accesses are outstanding.
- The ESB instruction does not order accesses and does not guarantee a pipeline flush.

All system errors must be synchronized by an ESB instruction, which guarantees the following:

- All system errors that are generated before the ESB instruction have pended a *System Error Interrupts* (SEI) exception.
- If a physical SEI is pended by or was pending before the ESB instruction executes, then:
 - It is taken before completion of the ESB instruction, if the physical SEI exception is unmasked at the current Exception level.
 - The pending SEI is cleared, the SEI status is recorded in DISR_EL1, and DISR_EL1.A is set to 1 if the physical SEI exception is masked at the current Exception level. It indicates that the SEI exception was generated before the ESB instruction by instructions that occur in program order.
- If a virtual SEI is pended by or was pending before the ESB instruction executes, then:
 - It is taken before completion of the ESB instruction, if the virtual SEI exception is unmasked.
 - The pending virtual SEI is cleared and the SEI status is recorded in VDISR_EL2 using the information provided by software in VESR_EL2, if the virtual SEI exception is masked.

After the `ESB` instruction, one of the following scenarios occurs:

- SEIs pended by errors are taken and their status is recorded in `ESR_ELn`.
- SEIs pended by errors are deferred and their status is recorded in `DISR_EL1` or `VDISR_EL2`.

This includes unrecoverable SEIs that are generated by instructions, translation table walks, and instruction fetches on the same core.

`DISR_EL1` can only be accessed at EL1 and above. If EL2 is implemented and `HCR_EL2.AMO` is set to 1, then reads and writes of `DISR_EL1` at Non-secure EL1 access `VDISR_EL2`.

Note

See the following registers:

- [3.2.61 DISR_EL1, Deferred Interrupt Status Register, EL1](#) on page 193.
 - [3.2.77 HCR_EL2, Hypervisor Configuration Register, EL2](#) on page 206.
 - [3.2.127 VDISR_EL2, Virtual Deferred Interrupt Status Register, EL2](#) on page 281.
-

2.8.6 Error recording

The component that detects an error is called a node. The Cortex®-A78AE core is a node that interacts with the *DynamiQ Shared Unit AE* (DSU-AE) node. There is one record per node for the errors detected.

For more information on error recording generated by cache protection, see the [Arm® Architecture Reference Manual Supplement, Reliability, Availability, and Serviceability \(RAS\), for A-profile architecture](#). The following points apply specifically to the Cortex®-A78AE core:

- In the Cortex®-A78AE core, any error that is detected is reported and recorded in the error record registers.
- There are two error records provided, which can be selected with the `ERRSELR_EL1` register:
 - Record 0 is private to the core, and is updated on any error in the core RAMs including L1 caches, TLB, and L2 cache.
 - Record 1 records any error in the L3 and snoop filter RAMs and is shared between all cores in the cluster.
- The fault handling interrupt is generated on the `nFAULTIRQ[0]` pin for L3 and snoop filter errors, or on the `nFAULTIRQ[n+1]` pin for core *n* L1 and L2 errors.

2.8.7 Error injection

The Cortex®-A78AE core supports fault injection for the purpose of testing fault handling software.

The core is programmable to inject an error for any of the possible error types (corrected error, deferred error, uncontainable error, and recoverable error) on a future memory access. When that access is performed, the core responds as if an error was detected on that access by asserting error interrupts, logging information in the error records, and taking aborts as appropriate for the type of error. Injecting an error will not affect the data in the RAM or the checking process itself. When a real error is detected on an access for which an injected error is programmed, the injected error will not prevent the core from handling the real error. The RAS register might log the injected error or the real error in this case.

To get the error injection to work:

- Program the Error Record Select Register (ERRSELR_EL1) to select Error record 0.
- Program the Error Record Control Register (ERROCTLR) to enable error detection/recovery and fault detection.
- Program the Error Pseudo Fault Generation Control Register (ERROPFGCTL) to allow error injection.

Note

- Cacheable code must also be executed, which will cause Cacheable transactions that can be injected with errors.
- For Cortex®-A78AE error injection, it is not required to set ERROCTLR.ED.

The following table describes all the possible types of error that the core can encounter and therefore inject.

Table 2-74: Errors injected in the Cortex®-A78AE core

Error type	Description
Corrected	A <i>Corrected Error</i> (CE) is generated for a single-bit ECC error on L1 data caches and L2 caches, both on data and tag RAMs.
Deferred	A <i>Deferred Error</i> (DE) is generated for a double-bit ECC error on L1 data caches and L2 caches, but only on data RAM.
Uncontainable	An <i>Uncontainable Error</i> (UC) is generated for a double-bit ECC error on L1 data caches and L2 caches, but only on tag RAM.

For error injection in the L1 data and L2 caches only L1 errors will be observed.

The following table describes the registers that handle error injection in the Cortex®-A78AE core.

Table 2-75: Error injection registers

Register name	Description
ERROPFGF	The ERR Pseudo Fault Generation Feature register defines which errors can be injected.
ERROPFGCTL	The ERR Pseudo Fault Generation Control register controls the errors that are injected.
ERROPFGCDN	The ERR Pseudo Fault Generation Count Down register controls the fault injection timing.

This mechanism simulates the corruption of any RAM but the data is not actually corrupted.

2.8.8 Cache-line lockout

Cortex®-A78AE has the capability to lockout cache lines for resilience against persistent hardware faults.

The cache-line lockout feature covers the L0 MOP cache, L1 instruction cache, L1 data cache, L2 TLB, and L2 cache. System software detects a persistent-fault using information from existing RAS error records or from pinned-out versions of the registers. The following three registers control and configure the cache line lockout feature, which allows the lock out of up to two cache-lines:

- CPUCLLCTLR_EL1
- CPUCLLO_ELI
- CPUCLL1_EL1

The CPUCLLCTLR_EL1 control register enables the cache-line lockout feature. The CPUCLLO_ELI and CPUCLL1_EL1 registers define the source, set, and way of the cache-array. Also, the CPUCLLO_ELI and CPUCLL1_EL1 registers share the same format as ERRORMISC. Because of this shared format, values can be directly copied from ERRORMISC to CPUCLLO_ELI and CPUCLL1_EL1 with no need to modify field formats. It is legal to program the CPUCLLO_ELI and CPUCLL1_EL1 registers to point to different lines of the same cache structure.

On detection of a persistent-fault, and before the caches are enabled following a reset, the system software configures the CPUCLLCTLR, CPUCLL0, and CPUCLL1 registers. Configuring the registers prevents allocation of specific set/way in specific RAMs and avoids the persistent-fault condition.

For more information on the cache-line lockout registers, see [3.2.43 CPUCLLCTLR_EL1, Cache Line Lockout Control Register, EL1](#) on page 159, [3.2.44 CPUCLL0_EL1, CPU Cache Line Lockout Register, EL1](#) on page 160, and [3.2.45 CPUCLL1_EL1, CPU Cache Line Lockout Register, EL1](#) on page 161.

2.9 Generic Interrupt Controller CPU interface

This chapter describes the Cortex®-A78AE core implementation of the Arm *Generic Interrupt Controller* (GIC) CPU interface.

2.9.1 About the Generic Interrupt Controller CPU interface

The Cortex®-A78AE core implements the GIC CPU interface as described in the Arm® *Generic Interrupt Controller Architecture Specification*.

This interfaces with an external GICv3 or GICv4 distributor component within the cluster system and is a resource for supporting and managing interrupts. The GIC CPU interface hosts registers to mask, identify, and control states of interrupts forwarded to that core. Each core in the cluster system has a GIC CPU interface component and connects to a common external distributor component.

This chapter describes only features that are specific to the Cortex®-A78AE core implementation. Additional information specific to the cluster can be found in the *Interfaces* in the *Arm® DynamIQ™ Shared Unit AE Technical Reference Manual*.

The GICv4 architecture supports:

- Two Security states
- Interrupt virtualization
- *Software-generated Interrupts* (SGIs)
- Message Based Interrupts
- System register access for the CPU interface
- Interrupt masking and prioritization
- Cluster environments, including systems that contain more than eight cores
- Wake up events in power management environments

The GIC includes interrupt grouping functionality that supports:

- Configuring each interrupt to belong to an interrupt group
- Signaling Group 1 interrupts to the target core using either the IRQ or the FIQ exception request. Group 1 interrupts can be Secure or Non-secure.
- Signaling Group 0 interrupts to the target core using the FIQ exception request only
- A unified scheme for handling the priority of Group 0 and Group 1 interrupts

This chapter describes only features that are specific to the Cortex®-A78AE core implementation.

Related information

[Generic Interrupt Controller registers](#) on page 308

2.9.2 Bypassing the CPU interface

The GIC CPU Interface is always implemented within the Cortex®-A78AE core.

However, you can disable it if you assert the GICCDISABLE signal HIGH at reset. If you disable the GIC CPU interface, the input pins nVIRQ and nVFIQ can be driven by an external GIC in the SoC. GIC system register access generates **UNDEFINED** instruction exceptions when the GICCDISABLE signal is HIGH.

If the GIC is enabled, the input pins nVIRQ and nVFIQ must be tied off to HIGH. This is because the internal GIC CPU interface generates the virtual interrupt signals to the cores. The nIRQ and nFIQ signals are controlled by software, therefore there is no requirement to tie them HIGH.

2.10 Advanced SIMD and floating-point support

This chapter describes the Advanced SIMD and floating-point features and registers in the Cortex®-A78AE core. The unit in charge of handling the Advanced SIMD and floating-point features is also referred to as the data engine in this manual.

2.10.1 About the Advanced SIMD and floating-point support

The Cortex®-A78AE core supports the Advanced SIMD and scalar floating-point instructions in the A64 instruction set and the Advanced SIMD and floating-point instructions in the A32 and T32 instruction sets.

The Cortex®-A78AE floating-point implementation:

- Does not generate floating-point exceptions.
- Implements all scalar operations in hardware with support for all combinations of:
 - Rounding modes
 - Flush-to-zero
 - Default *Not a Number* (NaN) modes

The Arm®v8-A architecture does not define a separate version number for its Advanced SIMD and floating-point support in the AArch64 Execution state because the instructions are always implicitly present.

2.10.2 Accessing the feature identification registers

Software can identify the Advanced SIMD and floating-point features using the feature identification registers in the AArch64 Execution state only.

The Cortex®-A78AE core only supports AArch32 in EL0, therefore none of the feature identification registers are accessible in the AArch32 Execution state.

You can access the feature identification registers in the AArch64 Execution state using the `MRS` instruction, for example:

```
MRS <Xt>, ID_AA64PFR0_EL1 ; Read ID_AA64PFR0_EL1 into Xt
MRS <Xt>, MVFR0_EL1       ; Read MVFR0_EL1 into Xt
MRS <Xt>, MVFR1_EL1       ; Read MVFR1_EL1 into Xt
MRS <Xt>, MVFR2_EL1       ; Read MVFR2_EL1 into Xt
```

Table 2-76: AArch64 Advanced SIMD and scalar floating-point feature identification registers

Register name	Description
ID_AA64PFR0_EL1	3.2.87 ID_AA64PFR0_EL1, AArch64 Processor Feature Register 0, EL1 on page 219

MVFR2_EL1	3.5.6 MVFR2_EL1, Media and VFP Feature Register 2, EL1 on page 343

2.11 Split-Lock feature

This chapter describes the Split-Lock feature of the Cortex®-A78AE core.

2.11.1 Implementing Split-Lock

The *DynamiQ Shared Unit AE* (DSU-AE) uses a specific Split-Lock implementation to enable the cluster to execute in either Split-mode, or Lock-mode, or the mixed execution Mixed-mode. Use the CEMODE input to select the required cluster execution mode at boot time.

All of the DSU-AE logic, except the RAMs, is duplicated. The RAMs are shared between the two copies of the logic. RAM sharing in this way saves significant area and improves the *Failure In Time* (FIT) rate. The SECDED ECC protection scheme is always enabled for all functional DSU-AE RAMs.

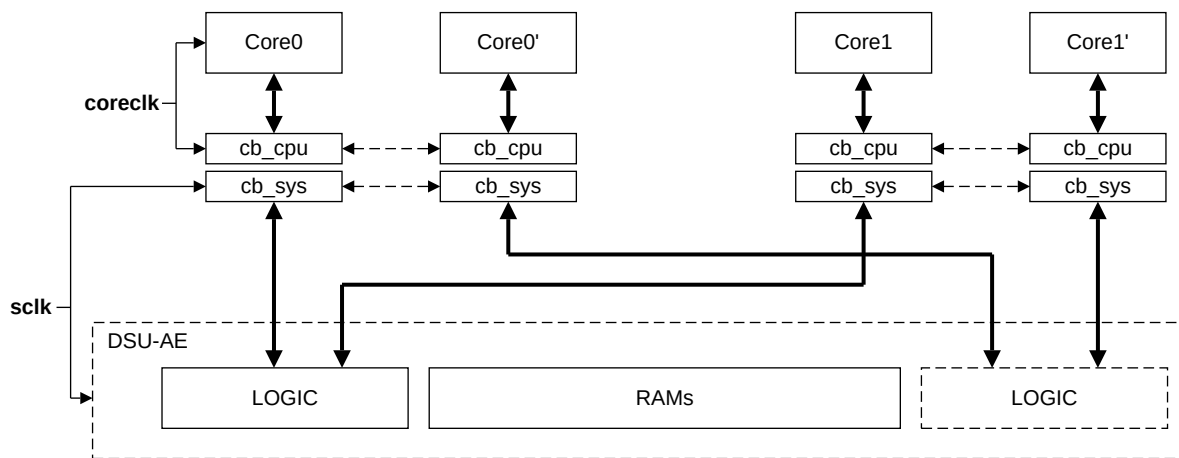

ECC protection is enabled for DSU-AE *functional* RAMs, that is, the L3 tag and data RAMs, the snoop filter, and the *Long-Term Data Buffer* (LTDB) RAM. The victim RAM is used for performance only and does not have ECC protection.

The DSU-AE uses a comparator with a registered output. In addition to the signals to be compared, the comparator includes a force input, and an enable that controls whether the compare generates an error. The force input can artificially force the comparator to generate an error result, to exercise the error reporting logic. To help protect against failures in the comparator, there are redundant copies of each of the comparators. A CPU bridge manages the asynchronous interface between the DSU-AE and the associated cores.

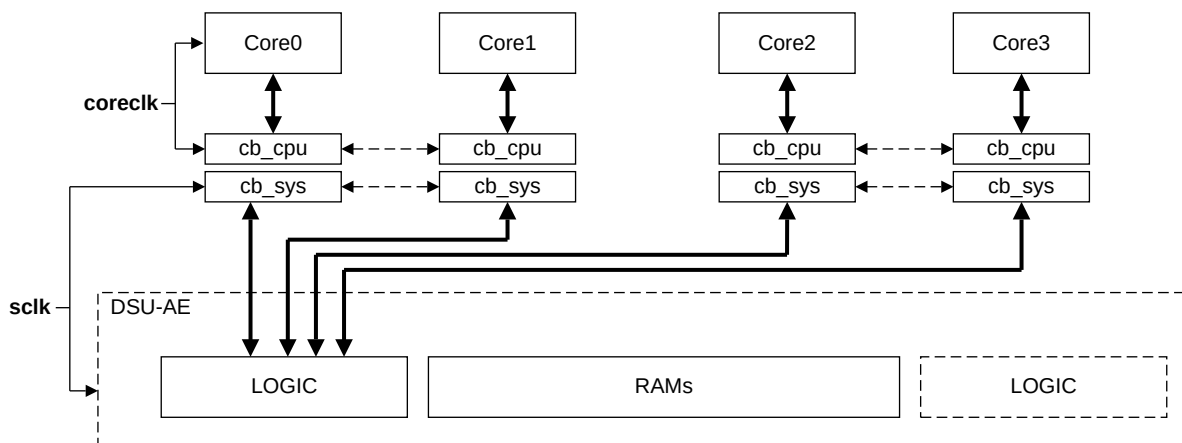

The following figure shows the DSU-AE Lock-mode operation, that is, where `CEMODE = 0b11`.

Figure 2-8: DSU-AE Lock-mode operation

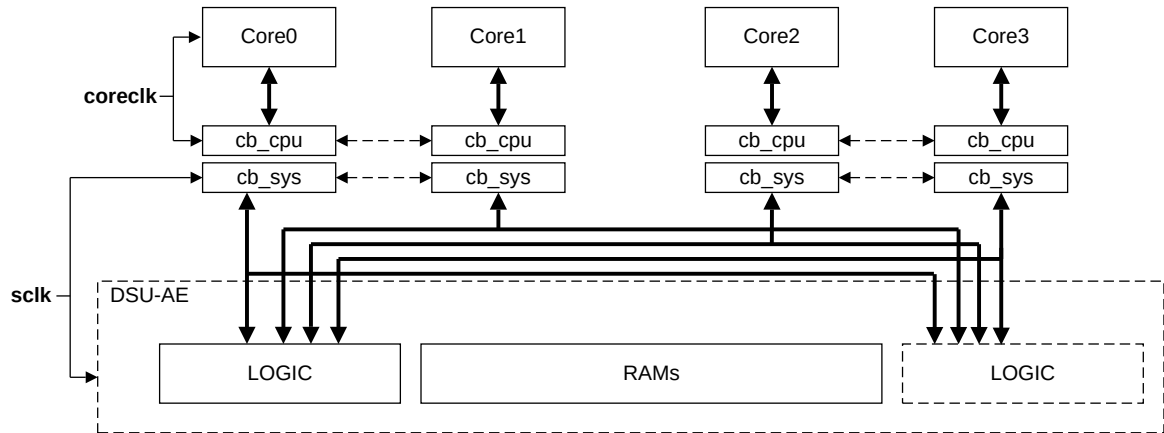

The following figure shows the DSU-AE Split-mode operation, that is, where `CEMODE = 0b01`.

Figure 2-9: DSU-AE Split-mode operation

The following figure shows the DSU-AE Mixed-mode operation, that is, where `CEMODE = 0b10`.

Figure 2-10: DSU-AE Mixed-mode operation

In Split-mode, all the cores are logically present. For example, in the figure above Core0, Core1, Core 2, and Core 3 are logically present.

Cortex®-A78AE supports a maximum of two core pairs per cluster for a total of four cores.

For more information on Split-mode, Lock-mode, and Mixed-mode, see the *Arm® DynamIQ™ Shared Unit AE Technical Reference Manual*.

2.11.1.1 CPU bridge

The CPU bridge for the Cortex®-A78AE is based on the *DynamIQ Shared Unit AE* (DSU-AE) CPU bridge. The DSU-AE CPU bridge provides the asynchronous bridging functionality, and the clock and power control logic for the core.

The objectives of the CPU bridge with Split-Lock capabilities are to:

- Enable lock-step execution with temporal diversity.
- Maintain lock-step execution after crossing an asynchronous boundary.
- Increase the detection of any transient and permanent faults that affect correct program flow.
- Provide a *Fault Management Unit* (FMU) to provide fault aggregation logic and safe reporting of faults and *Reliability, Availability, and Serviceability* (RAS) core signals.

The CPU bridge provides full duplication and appends each channel with logic to handle lock-step asynchronous execution.

CPU bridge synchronous mode logic is included to support CHI interfaces, and contains logic to handle asynchronous powerdown requests. If a permanent or transient fault affects correct program flow, a passive mismatch occurs in the DSU-AE comparators.

The outputs from the primary CPU bridge and the redundant CPU bridge are compared to check for errors. There are two comparators for redundancy, and therefore two sets of result outputs for signaling errors. The compare outputs are qualified with valid signals whenever possible, for example for payloads. Compare outputs are also aggregated per bridge channel, for example when using CHI. Timeout detectors can detect faults where comparators alone are not sufficient. Compare fault vectors are sticky, and are controlled using core inputs for enabling and forcing mismatches in compare groups. The compare fault vectors are presented to the cluster in the system clock domain, SCLK. In addition, the CPU bridge passes safe outputs of RAS core signals in the system clock domain.

2.11.1.2 Comparators

Comparator logic is only enabled when the Cortex®-A78AE is operating in Lock-mode. There are two instances of each comparator, reporting on separate outputs.

Delay flops are also associated with Lock-mode.

The delay flops:

- Create the temporal diversity between the primary and redundant logic.
- Align the comparison logic.

2.11.1.3 Core RAS reporting signals

The CPUECTLR_EL1[1] control bit forces reads from *Reliability, Availability, and Serviceability* (RAS) error record registers to Read-As-Zero instead of the current value in the register. This behavior prevents a read from these registers from causing divergence after a fault, where the only divergence is the updating of one or more of the RAS register bits.

Instead of register reads, the RAS register bits are output as pins from both the primary and redundant cores. In the *DynamlQ Shared Unit AE* (DSU-AE), these outputs correspond to core RAS reporting signals that the DSU-AE reports on the cluster output ports. Therefore, no divergence checks occur on these signals between the primary and redundant cores. The SoC is responsible for performing any required logical operations on these signals.

The following table shows the RAS error signals.

Table 2-77: RAS error signals

Core Signal	Core RAS reporting signal	Direction	Description
cpu_errmisc0[47:0]	COREERRMISC_CP<cp>_<P/R>[47:0]	Output	Current state of ERRORMISC0[47:0].
cpu_errstatus_ue	COREERR_UE_CP<cp>_<P/R>	Output	Current state of ERROSTATUS.UE
cpu_errstatus_de	COREERR_DE_CP<cp>_<P/R>	Output	Current state of ERROSTATUS.DE

Core Signal	Core RAS reporting signal	Direction	Description
cpu_errstatus_ce[1:0]	COREERR_CE_CP<cp>_<P/R>[1:0]	Output	Current state of ERROSTATUS.CE
cpu_errstatus_of	COREERR_OF_CP<cp>_<P/R>	Output	Current state of ERROSTATUS.OF
cpu_errstatus_av	COREERR_AV_CP<cp>_<P/R>	Output	Current state of ERROSTATUS.AV
cpu_err_addr[40:0]	COREERR_ADDR_CP<cp>_<P/R>[p:0]	Output	Current state of ERROADDR[NS,PADDR]
cpu_err_valid	COREERR_V_CP<cp>_<P/R>	Output	One-cycle pulse for each new error recorded. Note: Although the preceding signals might not actually change, cpu_err_valid is still asserted.

These error signals are reported to the DSU-AE. For more information, see the *Core RAS reporting signals* section in the *Arm® DynamIQ™ Shared Unit AE Integration Manual*.

Each core in the Cortex®-A78AE core pair routes the error signals through the CPU bridge. The CPU bridges contain the Split-Lock functionality that monitors divergence within the core pair. The CPU bridge fault management block aggregates all faults into a single vector and reports it with redundancy to the DSU-AE, as the following figure shows.

Figure 2-11: coredclsfault_p/r[7:0] CPU bridge fault vector

7	6	5	4	3	2	1	0
MISC	SRI	EVENT	TS	APB	ATB	GIC	CHI

The following table shows the CPU bridge fault vector bit assignments.

Table 2-78: coredclsfault_p/r[7:0] bit assignments

Bits	Name	Function
[7]	MISC	Clock, power, and reset logic.
[6]	SRI	System register timer logic.
[5]	EVENT	Event logic.
[4]	TS	Timestamp logic.
[3]	APB	Debug logic.
[2]	ATB	Trace logic.
[1]	GIC	<i>Generic Interrupt Controller (GIC)</i> logic.
[0]	CHI	CHI logic.

2.11.1.4 Detectable faults

In Lock-mode, comparators can detect a single fault occurring in either the functional logic or the redundant copy of the logic. The fault is discovered when it causes a difference in the compared outputs.

A fault in either of the comparators might also be detected.

Multiple faults occurring simultaneously might also be detected when the following statements are true:

- The same fault is not present in both the functional logic and the redundant copy at the same time.
- The faults cause a difference between the compared outputs of the functional logic and those of the redundant copy.

Some faults might not cause incorrect operation. For example, a fault in a register that is never read by the software running in a particular system might not cause incorrect operation.

2.11.1.5 Non-detectable faults

In Lock-mode, faults that do not cause any difference in observable behavior between the primary logic and the redundant logic are not detected.

Systematic faults in the primary logic are not detected by the comparators because the fault results in identical erroneous behavior in both primary and redundant logic.

2.11.1.6 Fault containment

Errors that are detected in Lock-mode cannot be contained.

The error on an output, to the external system or on one of the *DynamiQ Shared Unit* AE (DSU-AE) RAMs, might only be detected several cycles after it appears at the output. Therefore, it has potentially propagated into the system or into the RAM.

2.11.1.7 Fault reaction

The Cortex®-A78AE processor does not include any specific features to react to a fault detected by the lock-step mechanism.

System integrator

The system integrator might choose to reset the system on detecting a fault or initiate some other hardware or software recovery mechanism. It is not normally possible to discover whether the fault occurred in the functional logic, in the redundant copy, or in the comparators themselves.

Fault Reaction Time

It is not possible to quantify the *Fault Reaction Time* (FRT) for a fault in the processor that is detected by the lock-step mechanism. The reasons for this include:

- The fault might cause a bit in an internal register to be flipped. Until that register is read and affects the primary outputs of the processor, which might be many cycles later, the fault stays undetected. Alternatively, if this register is not used by the software running on the processor, it might never be detected.
- The number of clock cycles needed to propagate the fault to a primary output depends on the number of register (pipeline or buffer) stages between the fault location and the primary output.

Latent fault detection and control mechanisms

The latent faults that could lead to non-detection of faults either within the primary or redundant core are expected to occur within the delay registers or comparator elements. These elements are defined by the system integrator. The system integrator can include latent fault detection mechanisms in the delay and comparator elements as necessary. Faults which do not affect the externally observable behavior of one of the processors in a lock-step configuration are not detectable by the lock-step comparators.

3. Register descriptions

This part describes the non-debug registers of the Cortex®-A78AE core.

3.1 AArch32 system registers

This chapter describes the system registers in the AArch32 state.

3.1.1 AArch32 architectural system register summary

This chapter identifies the AArch32 architectural System registers implemented in the Cortex®-A78AE core.

The following table identifies the architecturally defined registers that are implemented in the Cortex®-A78AE core. For a description of these registers, see the [Arm® Architecture Reference Manual for A-profile architecture](#).

For the registers listed in the following table, coproc==0b1111.

Table 3-1: Architecturally defined registers

Name	CRn	Opc1	CRm	Opc2	Width	Description
CNTFRQ	c14	0	c0	0	32	Timer Clock Ticks per Second
CNTP_CTL	c14	0	c2	1	32	Counter-timer Physical Timer Control register
CNTP_CVAL	-	2	c14	-	64	Counter-timer Physical Timer CompareValue register
CNTP_TVAL	c14	0	c2	0	32	Counter-timer Physical Timer TimerValue register
CNTPCT	-	0	c14	-	64	Counter-timer Physical Count register
CNTV_CTL	c14	0	c3	1	32	Counter-timer Virtual Timer Control register
CNTV_CVAL	-	3	c14	-	64	Counter-timer Virtual Timer CompareValue register
CNTV_TVAL	c14	0	c3	0	32	Counter-timer Virtual Timer TimerValue register
CNTVCT	-	1	c14	-	64	Counter-timer Virtual Count register
CP15ISB	c7	0	c5	4	32	Instruction Synchronization Barrier System instruction
CP15DSB	c7	0	c10	4	32	Data Synchronization Barrier System instruction
CP15DMB	c7	0	c10	5	32	Data Memory Barrier System instruction
DLR	c4	3	c5	1	32	Debug Link Register
DSPSR	c4	3	c5	0	32	Debug Saved Program Status Register
TPIDRURO	c13	0	c0	3	32	User Read-Only Thread ID Register
TPIDRURW	c13	0	c0	2	32	User Read/Write Thread ID Register

3.2 AArch64 system registers

This chapter describes the system registers in the AArch64 state.

3.2.1 AArch64 registers

This chapter provides information about the AArch64 system registers with **IMPLEMENTATION DEFINED** bit fields and **IMPLEMENTATION DEFINED** registers associated with the core.

The chapter provides **IMPLEMENTATION SPECIFIC** information, for a complete description of the registers, see the [Arm® Architecture Reference Manual for A-profile architecture](#).

The chapter is presented as follows:

AArch64 architectural system register summary

This section identifies the AArch64 architectural system registers implemented in the Cortex®-A78AE core that have **IMPLEMENTATION DEFINED** bit fields. The register descriptions for these registers only contain information about the **IMPLEMENTATION DEFINED** bits.

AArch64 IMPLEMENTATION DEFINED register summary

This section identifies the AArch64 architectural registers implemented in the Cortex®-A78AE core that are **IMPLEMENTATION DEFINED**.

AArch64 registers by functional group

This section groups the **IMPLEMENTATION DEFINED** registers and architectural system registers with **IMPLEMENTATION DEFINED** bit fields, as identified previously, by function. It also provides reset details for key register types.

Register descriptions

The remainder of the chapter provides register descriptions of the **IMPLEMENTATION DEFINED** registers and architectural system registers with **IMPLEMENTATION DEFINED** bit fields, as identified previously. These are listed in alphabetic order.

3.2.2 AArch64 architectural system register summary

This section describes the AArch64 architectural system registers implemented in the Cortex®-A78AE core.

The section contains two tables:

Registers with implementation defined bit fields

This table identifies the architecturally defined registers in Cortex®-A78AE that have implementation defined bit fields. The register descriptions for these registers only contain information about the implementation defined bits.

See [Table 3-2: Registers with implementation defined bit fields](#) on page 97.

Other architecturally defined registers

This table identifies the other architecturally defined registers that are implemented in the Cortex®-A78AE core. These registers are described in the [Arm® Architecture Reference Manual for A-profile architecture](#).

See [Table 3-3: Other architecturally defined registers](#) on page 100.

Table 3-2: Registers with implementation defined bit fields

3.2.3 AArch64 implementation defined register summary

This section describes the AArch64 registers in the Cortex®-A78AE core that are **IMPLEMENTATION DEFINED**.

The following tables list the AArch64 implementation defined registers, sorted by opcode.

Table 3-4: AArch64 implementation defined registers

Name	Copro	CRn	Op1	CRm	Op2	Width	Description
ATCR_EL1	3	c15	0	c7	0	32	3.2.28 ATCR_EL1, Auxiliary Translation Control Register, EL1 on page 136
ATCR_EL2	3	c15	4	c7	0	32	3.2.29 ATCR_EL2, Auxiliary Translation Control Register, EL2 on page 139
ATCR_EL12	3	c15	5	c7	0	32	3.2.30 ATCR_EL12 , Alias to Auxiliary Translation Control Register EL1 on page 141
ATCR_EL3	3	c15	6	c7	0	32	3.2.31 ATCR_EL3, Auxiliary Translation Control Register, EL3 on page 142
AVTCR_EL2	3	c15	4	c7	1	32	3.2.32 AVTCR_EL2, Auxiliary Virtualized Translation Control Register, EL2 on page 143
CPUACTLR_EL1	3	c15	0	c1	0	64	3.2.38 CPUACTLR_EL1, CPU Auxiliary Control Register, EL1 on page 152
CPUACTLR2_EL1	3	c15	0	c1	1	64	3.2.39 CPUACTLR2_EL1, CPU Auxiliary Control Register 2, EL1 on page 153
CPUACTLR3_EL1	3	c15	0	c1	2	64	3.2.40 CPUACTLR3_EL1, CPU Auxiliary Control Register 3, EL1 on page 154
CPUACTLR5_EL1	3	c15	0	c9	0	64	3.2.41 CPUACTLR5_EL1, CPU Auxiliary Control Register 5, EL1 on page 156
CPUACTLR6_EL1	3	c15	0	c9	1	64	3.2.42 CPUACTLR6_EL1, CPU Auxiliary Control Register 6, EL1 on page 157
CPUCFR_EL1	3	c15	0	c0	0	32	3.2.46 CPUCFR_EL1, CPU Configuration Register, EL1 on page 162

Name	Copro	CRn	Op1	CRm	Op2	Width	Description
CPUECTLR_EL1	3	c15	0	c1	4	64	3.2.47 CPUECTLR_EL1, CPU Extended Control Register, EL1 on page 164
CPUECTLR2_EL1	3	c15	0	c1	5	64	3.2.48 CPUECTLR2_EL1, CPU Extended Control Register2, EL1 on page 174
CPUPCR_EL3	3	c15	6	c8	1	64	3.2.49 CPUPCR_EL3, CPU Private Control Register, EL3 on page 175
CPUPMR_EL3	3	c15	6	c8	3	64	3.2.51 CPUPMR_EL3, CPU Private Mask Register, EL3 on page 178
CPUPOR_EL3	3	c15	6	c8	2	64	3.2.53 CPUPOR_EL3, CPU Private Operation Register, EL3 on page 181
CPUPPMCR_EL3	3	c15	6	c2	0	64	3.2.55 CPUPPMCR_EL3, CPU Power Performance Management Configuration Register, EL3 on page 184
CPUPSELR_EL3	3	c15	6	c8	0	32	3.2.56 CPUPSELR_EL3, CPU Private Selection Register, EL3 on page 185
CPUPWRCTLR_EL1	3	c15	0	c2	7	32	3.2.57 CPUPWRCTLR_EL1, Power Control Register, EL1 on page 186
ERXPFPGCDN_EL1	3	c15	0	c2	2	32	3.2.69 ERXPFPGCDN_EL1, Selected Error Pseudo Fault Generation Count Down Register, EL1 on page 198
ERXPFPGCTL_EL1	3	c15	0	c2	1	32	3.2.70 ERXPFPGCTL_EL1, Selected Error Pseudo Fault Generation Control Register, EL1 on page 199
ERXPFPGF_EL1	3	c15	0	c2	0	32	3.2.71 ERXPFPGF_EL1, Selected Pseudo Fault Generation Feature Register, EL1 on page 200

The following table shows the 32-bit wide implementation defined Cluster registers. Details of these registers can be found in *Arm® DynamIQ™ Shared Unit AE Technical Reference Manual*.

Table 3-5: Cluster registers

Name	Copro	CRn	Opc1	CRm	Opc2	Width	Description
CLUSTERCFR_EL1	3	c15	0	c3	0	32-bit	Cluster configuration register
CLUSTERIDR_EL1	3	c15	0	c3	1	32-bit	Cluster main revision ID
CLUSTEREVIDR_EL1	3	c15	0	c3	2	32-bit	Cluster ECO ID
CLUSTERACTLR_EL1	3	c15	0	c3	3	32-bit	Cluster auxiliary control register
CLUSTERECTLR_EL1	3	c15	0	c3	4	32-bit	Cluster extended control register
CLUSTERPWRCTLR_EL1	3	c15	0	c3	5	32-bit	Cluster power control register
CLUSTERPWRDN_EL1	3	c15	0	c3	6	32-bit	Cluster power down register
CLUSTERPWRSTAT_EL1	3	c15	0	c3	7	32-bit	Cluster power status register
CLUSTERTHREADSID_EL1	3	c15	0	c4	0	32-bit	Cluster thread scheme ID register
CLUSTERACPSID_EL1	3	c15	0	c4	1	32-bit	Cluster ACP scheme ID register
CLUSTERSTASHSID_EL1	3	c15	0	c4	2	32-bit	Cluster stash scheme ID register
CLUSTERPARTCR_EL1	3	c15	0	c4	3	32-bit	Cluster partition control register
CLUSTERBUSQOS_EL1	3	c15	0	c4	4	32-bit	Cluster bus QoS control register
CLUSTERL3HIT_EL1	3	c15	0	c4	5	32-bit	Cluster L3 hit counter register
CLUSTERL3MISS_EL1	3	c15	0	c4	6	32-bit	Cluster L3 miss counter register
CLUSTERTHREADSIDOVR_EL1	3	c15	0	c4	7	32-bit	Cluster thread scheme ID override register
CLUSTERPMCR_EL1	3	c15	0	c5	0	32-bit	Cluster Performance Monitors Control Register
CLUSTERPMCNTENSET_EL1	3	c15	0	c5	1	32-bit	Cluster Count Enable Set Register
CLUSTERPMCNTENCLR_EL1	3	c15	0	c5	2	32-bit	Cluster Count Enable Clear Register
CLUSTERPMOVSSSET_EL1	3	c15	0	c5	3	32-bit	Cluster Overflow Flag Status Set

Name	Copro	CRn	Opc1	CRm	Opc2	Width	Description
CLUSTERPMOVSLR_EL1	3	c15	0	c5	4	32-bit	Cluster Overflow Flag Status Clear
CLUSTERPMSELR_EL1	3	c15	0	c5	5	32-bit	Cluster Event Counter Selection Register
CLUSTERPMINTENSET_EL1	3	c15	0	c5	6	32-bit	Cluster Interrupt Enable Set Register
CLUSTERPMINTENCLR_EL1	3	c15	0	c5	7	32-bit	Cluster Interrupt Enable Clear Register
CLUSTERPMXEVTYPER_EL1	3	c15	0	c6	1	32-bit	Cluster Selected Event Type and Filter Register
CLUSTERPMXEVNTR_EL1	3	c15	0	c6	2	32-bit	Cluster Selected Event Counter Register
Reserved/RAZ	3	c15	0	c6	3	32-bit	Cluster Monitor Debug Configuration Register
CLUSTERPMCEID0_EL1	3	c15	0	c6	4	32-bit	Cluster Common Event Identification ID0 Register
CLUSTERPMCEID1_EL1	3	c15	0	c6	5	32-bit	Cluster Common Event Identification ID1 Register
CLUSTERPMCLAIMSET_EL1	3	c15	0	c6	6	32-bit	Cluster Performance Monitor Claim Tag Set Register
CLUSTERPMCLAIMCLR_EL1	3	c15	0	c6	7	32-bit	Cluster Performance Monitor Claim Tag Clear Register

3.2.4 AArch64 registers by functional group

This section identifies the AArch64 registers by their functional groups and applies to the registers in the core that are implementation defined or have micro-architectural bit fields. Reset values are provided for these registers.

Table 3-6: Identification registers

Name	Type	Reset	Description
AIDR_EL1	RO	0x00000000	3.2.14 AIDR_EL1, Auxiliary ID Register, EL1 on page 121
CCSIDR_EL1	RO	-	3.2.33 CCSIDR_EL1, Cache Size ID Register, EL1 on page 145
CLIDR_EL1	RO	<ul style="list-style-type: none"> 0xC3000123 if L3 cache present. 0x82000023 if no L3 cache. 	3.2.34 CLIDR_EL1, Cache Level ID Register, EL1 on page 147
CSSELR_EL1	RW	UNK	3.2.58 CSSELR_EL1, Cache Size Selection Register, EL1 on page 189
CTR_ELO	RO	0x9444C004	3.2.59 CTR_ELO, Cache Type Register, ELO on page 190
DCZID_ELO	RO	0x00000004	3.2.60 DCZID_ELO, Data Cache Zero ID Register, ELO on page 192
ERRIDR_EL1	RO	0x00000002	3.2.62 ERRIDR_EL1, Error ID Register, EL1 on page 195
ID_AA64AFR0_EL1	RO	0x00000000	3.2.78 ID_AA64AFR0_EL1, AArch64 Auxiliary Feature Register 0 on page 209
ID_AA64AFR1_EL1	RO	0x00000000	3.2.79 ID_AA64AFR1_EL1, AArch64 Auxiliary Feature Register 1 on page 209
ID_AA64DFR0_EL1	RO	0x0000000110305408	3.2.80 ID_AA64DFR0_EL1, AArch64 Debug Feature Register 0, EL1 on page 209
ID_AA64DFR1_EL1	RO	0x00000000	3.2.81 ID_AA64DFR1_EL1, AArch64 Debug Feature Register 1, EL1 on page 210

Name	Type	Reset	Description

ID_PFR1_EL1	RO	0x10010000 Bits [31:28] are 0x1 if the GIC CPU interface is implemented and enabled, and 0x0 otherwise.	3.2.104 ID_PFR1_EL1, AArch32 Processor Feature Register 1, EL1 on page 249
LORID_EL1	RO	0x00000000000040004	3.2.107 LORID_EL1, LORegion ID Register, EL1 on page 253
MIDR_EL1	RO	0x410FD423	3.2.110 MIDR_EL1, Main ID Register, EL1 on page 257
MPIDR_EL1	RO	The reset value depends on CLUSTERIDAFF2[7:0] and CLUSTERIDAFF3[7:0]. See register description for details.	3.2.111 MPIDR_EL1, Multiprocessor Affinity Register, EL1 on page 258
REVIDR_EL1	RO	0x00000000	3.2.113 REVIDR_EL1, Revision ID Register, EL1 on page 261
VMPIDR_EL2	RW	The reset value is the value of MPIDR_EL1.	Virtualization Multiprocessor ID Register EL2
VPIDR_EL2	RW	The reset value is the value of MIDR_EL1.	Virtualization Core ID Register EL2

Table 3-7: Other system control registers

Name	Type	Description
ACTLR_EL1	RW	3.2.5 ACTLR_EL1, Auxiliary Control Register, EL1 on page 110
ACTLR_EL2	RW	3.2.6 ACTLR_EL2, Auxiliary Control Register, EL2 on page 111
ACTLR_EL3	RW	3.2.7 ACTLR_EL3, Auxiliary Control Register, EL3 on page 113
CPACR_EL1	RW	3.2.35 CPACR_EL1, Architectural Feature Access Control Register, EL1 on page 149
SCTLR_EL1	RW	3.2.116 SCTLR_EL1, System Control Register, EL1 on page 263
SCTLR_EL2	RW	3.2.117 SCTLR_EL2, System Control Register, EL2 on page 266
SCTLR_EL3	RW	3.2.118 SCTLR_EL3, System Control Register, EL3 on page 270
SCTLR_EL12	RW	3.2.116 SCTLR_EL1, System Control Register, EL1 on page 263

Table 3-8: Reliability, Availability, Serviceability (RAS) registers

Name	Type	Description
DISR_EL1	RW	3.2.61 DISR_EL1, Deferred Interrupt Status Register, EL1 on page 193
ERRIDR_EL1	RW	3.2.62 ERRIDR_EL1, Error ID Register, EL1 on page 195
ERRSELR_EL1	RW	3.2.63 ERRSELR_EL1, Error Record Select Register, EL1 on page 196
ERXADDR_EL1	RW	3.2.64 ERXADDR_EL1, Selected Error Record Address Register, EL1 on page 196
ERXCTLR_EL1	RW	3.2.65 ERXCTLR_EL1, Selected Error Record Control Register, EL1 on page 196
ERXFR_EL1	RO	3.2.66 ERXFR_EL1, Selected Error Record Feature Register, EL1 on page 197
ERXMISCO_EL1	RW	3.2.67 ERXMISCO_EL1, Selected Error Record Miscellaneous Register 0, EL1 on page 197
ERXMISC1_EL1	RW	3.2.68 ERXMISC1_EL1, Selected Error Record Miscellaneous Register 1, EL1 on page 197
ERXSTATUS_EL1	RW	3.2.72 ERXSTATUS_EL1, Selected Error Record Primary Status Register, EL1 on page 201

Name	Type	Description
ERXPFPGCDN_EL1	RW	3.2.69 ERXPFPGCDN_EL1, Selected Error Pseudo Fault Generation Count Down Register, EL1 on page 198
ERXPFCCTL_EL1	RW	3.2.70 ERXPFGCTL_EL1, Selected Error Pseudo Fault Generation Control Register, EL1 on page 199
ERXPFGF_EL1	RO	3.2.71 ERXPFGF_EL1, Selected Pseudo Fault Generation Feature Register, EL1 on page 200
HCR_EL2	RW	3.2.77 HCR_EL2, Hypervisor Configuration Register, EL2 on page 206
VDISR_EL2	RW	3.2.127 VDISR_EL2, Virtual Deferred Interrupt Status Register, EL2 on page 281
VSESR_EL2	RW	3.2.129 VSESR_EL2, Virtual SError Exception Syndrome Register on page 282

Table 3-9: Virtual Memory control registers

Name	Type	Description
AMAIR_EL1	RW	3.2.15 AMAIR_EL1, Auxiliary Memory Attribute Indirection Register, EL1 on page 121
AMAIR_EL2	RW	3.2.16 AMAIR_EL2, Auxiliary Memory Attribute Indirection Register, EL2 on page 122
AMAIR_EL3	RW	3.2.17 AMAIR_EL3, Auxiliary Memory Attribute Indirection Register, EL3 on page 123
ATCR_EL1	RW	3.2.28 ATCR_EL1, Auxiliary Translation Control Register, EL1 on page 136
ATCR_EL2	RW	3.2.29 ATCR_EL2, Auxiliary Translation Control Register, EL2 on page 139
ATCR_EL12	RW	3.2.30 ATCR_EL12, Alias to Auxiliary Translation Control Register EL1 on page 141
ATCR_EL3	RW	3.2.31 ATCR_EL3, Auxiliary Translation Control Register, EL3 on page 142
AVTCR_EL2	RW	3.2.32 AVTCR_EL2, Auxiliary Virtualized Translation Control Register, EL2 on page 143
LORC_EL1	RW	3.2.106 LORC_EL1, LORegion Control Register, EL1 on page 252
LOREA_EL1	RW	LORegion End Address Register EL1
LORID_EL1	RO	3.2.107 LORID_EL1, LORegion ID Register, EL1 on page 253
LORN_EL1	RW	3.2.108 LORN_EL1, LORegion Number Register, EL1 on page 254
LORSA_EL1	RW	LORegion Start Address Register EL1
TCR_EL1	RW	3.2.119 TCR_EL1, Translation Control Register, EL1 on page 272
TCR_EL2	RW	3.2.120 TCR_EL2, Translation Control Register, EL2 on page 274
TCR_EL3	RW	3.2.121 TCR_EL3, Translation Control Register, EL3 on page 275

3.2.18 APDAKeyHi_EL1, Pointer Authentication Key A for Data

APDAKeyHi_EL1 holds bits [63:0] of key A used for authentication of instruction pointer values.

Bit field descriptions

The APDAKeyHi_EL1 is a 64-bit register.

Figure 3-14: APDAKeyHi_EL1 bit assignments

Bits [63:0]

64 bit value, bits[63:0] of the 128 bit pointer authentication key value.

This field resets to an architecturally **UNKNOWN** value.

Configurations

This register is present only when ARMv8.3-PAuth is implemented. Otherwise, direct accesses to APDAKeyHi_EL1 are **UNDEFINED**. RW fields in this register reset to architecturally **UNKNOWN** values.

Usage constraints

Accessing APDAKeyHi_EL1

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This register can be written using MRS (register) with the following syntax:

```
MRS <Xt>, <systemreg>
```

Register access is encoded as follows:

Table 3-17: APDAKeyHi_EL1 encoding

<systemreg>	op0	op1	CRn	CRm	op2
S3_0_C2_C2_1	11	000	0010	0010	001

This register is accessible as follows:

<systemreg>	EL0	EL1	EL2	EL3
S3_0_C2_C2_1	-	RW	n/a	RW
S3_0_C2_C2_1	-	RW	RW	RW
S3_0_C2_C2_1	-	n/a	RW	RW

Traps and enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization* in the [Arm® Architecture Reference Manual for A-profile architecture](#) for exceptions taken to AArch64 state.

3.2.19 APDAKeyLo_EL1, Pointer Authentication Key A for Data

APDAKeyLo_EL1 holds bits [63:0] of key A used for authentication of instruction pointer values.

Bit field descriptions

The APDAKeyLo_EL1 is a 64-bit register.

Figure 3-15: APDAKeyLo_EL1 bit assignments

Bits [63:0]

64 bit value, bits[63:0] of the 128 bit pointer authentication key value.

This field resets to an architecturally **UNKNOWN** value.

Configurations

This register is present only when ARMv8.3-PAuth is implemented. Otherwise, direct accesses to APDAKeyLo_EL1 are **UNDEFINED**. RW fields in this register reset to architecturally **UNKNOWN** values.

Usage constraints

Accessing APDAKeyLo_EL1

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This register can be written using MRS (register) with the following syntax:

```
MRS <Xt>, <systemreg>
```

Register access is encoded as follows:

Table 3-19: APDAKeyLo_EL1 encoding

<systemreg>	op0	op1	CRn	CRm	op2
S3_0_C2_C2_0	11	000	0010	0010	000

This register is accessible as follows:

<systemreg>	EL0	EL1	EL2	EL3
S3_0_C2_C2_0	-	RW	n/a	RW
S3_0_C2_C2_0	-	RW	RW	RW
S3_0_C2_C2_0	-	n/a	RW	RW

Traps and enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization* in the [Arm® Architecture Reference Manual for A-profile architecture](#) for exceptions taken to AArch64 state.

3.2.20 APDBKeyHi_EL1, Pointer Authentication Key B for Data

APDBKeyHi_EL1 holds bits [63:0] of key B used for authentication of instruction pointer values.

Bit field descriptions

The APDBKeyHi_EL1 is a 64-bit register.

Figure 3-16: APDBKeyHi_EL1 bit assignments

Bits [63:0]

64 bit value, bits[63:0] of the 128 bit pointer authentication key value.

This field resets to an architecturally **UNKNOWN** value.

Configurations

This register is present only when ARMv8.3-PAuth is implemented. Otherwise, direct accesses to APDBKeyHi_EL1 are **UNDEFINED**. RW fields in this register reset to architecturally **UNKNOWN** values.

Usage constraints**Accessing APDBKeyHi_EL1**

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This register can be written using MRS (register) with the following syntax:

```
MRS <Xt>, <systemreg>
```

Register access is encoded as follows:

Table 3-21: APDBKeyHi_EL1 encoding

<systemreg>	op0	op1	CRn	CRm	op2
S3_0_C2_C2_3	11	000	0010	0010	011

This register is accessible as follows:

<systemreg>	EL0	EL1	EL2	EL3
S3_0_C2_C2_3	-	RW	n/a	RW
S3_0_C2_C2_3	-	RW	RW	RW
S3_0_C2_C2_3	-	n/a	RW	RW

Traps and enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization* in the [Arm® Architecture Reference Manual for A-profile architecture](#) for exceptions taken to AArch64 state.

3.2.21 APDBKeyLo_EL1, Pointer Authentication Key B for Data

APDBKeyLo_EL1 holds bits [63:0] of key B used for authentication of instruction pointer values.

Bit field descriptions

The APDBKeyLo_EL1 is a 64-bit register.

Figure 3-17: APDBKeyLo_EL1 bit assignments

Bits [63:0]

64 bit value, bits[63:0] of the 128 bit pointer authentication key value.

This field resets to an architecturally **UNKNOWN** value.

Configurations

This register is present only when ARMv8.3-PAuth is implemented. Otherwise, direct accesses to APDBKeyLo_EL1 are **UNDEFINED**. RW fields in this register reset to architecturally **UNKNOWN** values.

Usage constraints

Accessing APDBKeyLo_EL1

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This register can be written using MRS (register) with the following syntax:

```
MRS <Xt>, <systemreg>
```

Register access is encoded as follows:

Table 3-23: APDBKeyLo_EL1 encoding

<systemreg>	op0	op1	CRn	CRm	op2
S3_0_C2_C2_2	11	000	0010	0010	010

This register is accessible as follows:

<systemreg>	EL0	EL1	EL2	EL3
S3_0_C2_C2_2	-	RW	n/a	RW
S3_0_C2_C2_2	-	RW	RW	RW
S3_0_C2_C2_2	-	n/a	RW	RW

Traps and enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization* in the [Arm® Architecture Reference Manual for A-profile architecture](#) for exceptions taken to AArch64 state.

3.2.22 APGAKeyHi_EL1, Pointer Authentication Key A for Code

APGAKeyHi_EL1 holds bits [63:0] of key A used for authentication of instruction pointer values.

Bit field descriptions

The APGAKeyHi_EL1 is a 64-bit register.

Figure 3-18: APGAKeyHi_EL1 bit assignments

Bits [63:0]

64 bit value, bits[63:0] of the 128 bit pointer authentication key value.

This field resets to an architecturally **UNKNOWN** value.

Configurations

This register is present only when ARMv8.3-PAuth is implemented. Otherwise, direct accesses to APGAKeyHi_EL1 are **UNDEFINED**. RW fields in this register reset to architecturally **UNKNOWN** values.

Usage constraints

Accessing APGAKeyHi_EL1

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This register can be written using MRS (register) with the following syntax:

```
MRS <Xt>, <systemreg>
```

Register access is encoded as follows:

Table 3-25: APGAKeyHi_EL1 encoding

<systemreg>	op0	op1	CRn	CRm	op2
S3_0_C2_C3_1	11	000	0010	0011	001

This register is accessible as follows:

<systemreg>	EL0	EL1	EL2	EL3
S3_0_C2_C3_1	-	RW	n/a	RW
S3_0_C2_C3_1	-	RW	RW	RW
S3_0_C2_C3_1	-	n/a	RW	RW

Traps and enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization* in the [Arm® Architecture Reference Manual for A-profile architecture](#) for exceptions taken to AArch64 state.

3.2.23 APGAKeyLo_EL1, Pointer Authentication Key A for Code

APGAKeyLo_EL1 holds bits [63:0] of key A used for authentication of instruction pointer values.

Bit field descriptions

The APGAKeyLo_EL1 is a 64-bit register.

Figure 3-19: APGAKeyLo_EL1 bit assignments

Bits [63:0]

64 bit value, bits[63:0] of the 128 bit pointer authentication key value.

This field resets to an architecturally **UNKNOWN** value.

Configurations

This register is present only when ARMv8.3-PAuth is implemented. Otherwise, direct accesses to APGAKeyLo_EL1 are **UNDEFINED**. RW fields in this register reset to architecturally **UNKNOWN** values.

Usage constraints

Accessing APGAKeyLo_EL1

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This register can be written using MRS (register) with the following syntax:

```
MRS <Xt>, <systemreg>
```

Register access is encoded as follows:

Table 3-27: APGAKeyLo_EL1 encoding

<systemreg>	op0	op1	CRn	CRm	op2
S3_0_C2_C3_0	11	000	0010	0011	000

This register is accessible as follows:

<systemreg>	EL0	EL1	EL2	EL3
S3_0_C2_C3_0	-	RW	n/a	RW
S3_0_C2_C3_0	-	RW	RW	RW
S3_0_C2_C3_0	-	n/a	RW	RW

Traps and enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization* in the [Arm® Architecture Reference Manual for A-profile architecture](#) for exceptions taken to AArch64 state.

3.2.24 APIAKeyHi_EL1, Pointer Authentication Key A for Instruction

APIAKeyHi_EL1 holds bits [63:0] of key A used for authentication of instruction pointer values.

Bit field descriptions

The APIAKeyHi_EL1 is a 64-bit register.

Figure 3-20: APIAKeyHi_EL1 bit assignments

Bits [63:0]

64 bit value, bits[63:0] of the 128 bit pointer authentication key value.

This field resets to an architecturally **UNKNOWN** value.

Configurations

This register is present only when ARMv8.3-PAuth is implemented. Otherwise, direct accesses to APIAKeyHi_EL1 are **UNDEFINED**. RW fields in this register reset to architecturally **UNKNOWN** values.

Usage constraints**Accessing APIAKeyHi_EL1**

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This register can be written using MRS (register) with the following syntax:

```
MSR <Xt>, <systemreg>
```

Register access is encoded as follows:

Table 3-29: APIAKeyHi_EL1 encoding

<systemreg>	op0	op1	CRn	CRm	op2
S3_0_C2_C1_1	11	000	0010	0001	001

This register is accessible as follows:

<systemreg>	EL0	EL1	EL2	EL3
S3_0_C2_C1_1	-	RW	n/a	RW
S3_0_C2_C1_1	-	RW	RW	RW
S3_0_C2_C1_1	-	n/a	RW	RW

Traps and enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization* in the [Arm® Architecture Reference Manual for A-profile architecture](#) for exceptions taken to AArch64 state.

3.2.25 APIAKeyLo_EL1, Pointer Authentication Key A for Instruction

APIAKeyLo_EL1 holds bits [63:0] of key A used for authentication of instruction pointer values.

Bit field descriptions

The APIAKeyLo_EL1 is a 64-bit register.

Figure 3-21: APIAKeyLo_EL1 bit assignments

Bits [63:0]
64 bit value, bits[63:0] of the 128 bit pointer authentication key value.

This field resets to an architecturally **UNKNOWN** value.

Configurations
This register is present only when ARMv8.3-PAuth is implemented. Otherwise, direct accesses to APIAKeyLo_EL1 are **UNDEFINED**. RW fields in this register reset to architecturally **UNKNOWN** values.

Usage constraints

Accessing APIAKeyLo_EL1
This register can be written using MSR (register) with the following syntax:

```
MRS <systemreg>, <Xt>
```

This register can be written using MSR (register) with the following syntax:

```
MRS <Xt>, <systemreg>
```

Register access is encoded as follows:

Table 3-31: APIAKeyLo_EL1 encoding

<systemreg>	op0	op1	CRn	CRm	op2
S3_0_C2_C1_0	11	000	0010	0001	000

This register is accessible as follows:

<systemreg>	EL0	EL1	EL2	EL3
S3_0_C2_C1_0	-	RW	n/a	RW
S3_0_C2_C1_0	-	RW	RW	RW
S3_0_C2_C1_0	-	n/a	RW	RW

Traps and enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization* in the [Arm® Architecture Reference Manual for A-profile architecture](#) for exceptions taken to AArch64 state.

3.2.26 APIBKeyHi_EL1, Pointer Authentication Key B for Instruction

APIBKeyHi_EL1 holds bits [63:0] of key B used for authentication of instruction pointer values.

Bit field descriptions

The APIBKeyHi_EL1 is a 64-bit register.

Figure 3-22: APIBKeyHi_EL1 bit assignments

Bits [63:0]

64 bit value, bits[63:0] of the 128 bit pointer authentication key value.

This field resets to an architecturally **UNKNOWN** value.

Configurations

This register is present only when ARMv8.3-PAuth is implemented. Otherwise, direct accesses to APIBKeyHi_EL1 are **UNDEFINED**. RW fields in this register reset to architecturally **UNKNOWN** values.

Usage constraints

Accessing APIBKeyHi_EL1

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This register can be written using MRS (register) with the following syntax:

```
MRS <Xt>, <systemreg>
```

Register access is encoded as follows:

Table 3-33: APIBKeyHi_EL1 encoding

<systemreg>	op0	op1	CRn	CRm	op2
S3_0_C2_C1_3	11	000	0010	0001	011

This register is accessible as follows:

<systemreg>	EL0	EL1	EL2	EL3
S3_0_C2_C1_3	-	RW	n/a	RW
S3_0_C2_C1_3	-	RW	RW	RW
S3_0_C2_C1_3	-	n/a	RW	RW

Traps and enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization* in the [Arm® Architecture Reference Manual for A-profile architecture](#) for exceptions taken to AArch64 state.

3.2.27 APIBKeyLo_EL1, Pointer Authentication Key B for Instruction

APIBKeyLo_EL1 holds bits [63:0] of key B used for authentication of instruction pointer values.

Bit field descriptions

The APIBKeyLo_EL1 is a 64-bit register.

Figure 3-23: APIBKeyLo_EL1 bit assignments

Bits [63:0]

64 bit value, bits[63:0] of the 128 bit pointer authentication key value.

This field resets to an architecturally **UNKNOWN** value.

Configurations

This register is present only when ARMv8.3-PAuth is implemented. Otherwise, direct accesses to APIBKeyLo_EL1 are **UNDEFINED**. RW fields in this register reset to architecturally **UNKNOWN** values.

Usage constraints

Accessing APIBKeyLo_EL1

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This register can be written using MRS (register) with the following syntax:

```
MRS <Xt>, <systemreg>
```

Register access is encoded as follows:

Table 3-35: APIBKeyLo_EL1 encoding

<systemreg>	op0	op1	CRn	CRm	op2
S3_0_C2_C1_2	11	000	0010	0001	010

This register is accessible as follows:

<systemreg>	EL0	EL1	EL2	EL3
S3_0_C2_C1_2	-	RW	n/a	RW
S3_0_C2_C1_2	-	RW	RW	RW
S3_0_C2_C1_2	-	n/a	RW	RW

Traps and enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization* in the [Arm® Architecture Reference Manual for A-profile architecture](#) for exceptions taken to AArch64 state.

3.2.28 ATCR_EL1, Auxiliary Translation Control Register, EL1

The ATCR_EL1 determines the values of PBHA on translation table walks memory access in EL1 translation regime.

Bit field descriptions

ATCR_EL1 is a 64-bit register.

Figure 3-24: ATCR_EL1 bit assignments**RES0, [63:14]**

RES0

Reserved

HWVAL160, [13]

Indicates the value of PBHA[1] on translation table walks memory access targeting the base address defined by TTBR1_EL1 if HWEN160 is set.

HWVAL159, [12]

Indicates the value of PBHA[0] on translation table walks memory access targeting the base address defined by TTBR1_EL1 if HWEN159 is set.

RES0, [11:10]

RES0

Reserved

HWVAL060, [9]

Indicates the value of PBHA[1] translation table walks memory access targeting the base address defined by TTBRO_EL1 if HWEN060 is set.

HWVAL059, [8]

Indicates the value of PBHA[1] translation table walks memory access targeting the base address defined by TTBRO_EL1 if HWEN059 is set.

RES0, [7:6]

RES0

Reserved

HWEN160, [5]

Enables PBHA[1] translation table walks memory access targeting the base address defined by TTBR1_EL1. If this bit is clear, PBHA[1] on translation table walks is 0.

HWEN159, [4]

Enables PBHA[0] translation table walks memory access targeting the base address defined by TTBR1_EL1. If this bit is clear, PBHA[0] on translation table walks is 0.

RES0, [3:2]

RES0 Reserved

HWEN060, [1]

Enables PBHA[1] translation table walks memory access targeting the base address defined by TTBR0_EL1. If this bit is clear, PBHA[1] on translation table walks is 0.

HWEN059, [0]

Enables PBHA[0] translation table walks memory access targeting the base address defined by TTBR0_EL1. If this bit is clear, PBHA[0] on translation table walks is 0.

Configurations

AArch64 register ATCR_EL1 is mapped to AArch32 register ATTCR (NS).

At EL2 with HCR_EL2.E2H set, accesses to ATCR_EL1 are remapped to access ATCR_EL2.

Usage constraints**Accessing the ATCR_EL1**

To access the ATCR_EL1:

```
MRS Xt, S<3>0 c15 c7 0>; Read ATCR_EL1 into Xt
MSR S<3>0 c15 c7 0>, Xt; Write Xt to ATCR_EL1
```

This syntax is encoded with the following settings in the instruction encoding:

Op0	Op1	CRn	CRm	Op2
3	0	c15	c7	0

Accessibility

ATCR_EL1 is accessible as follows:

Name	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
ATCR_EL1	x	x	0	-	RW	n/a	RW
ATCR_EL1	0	0	1	-	RW	RW	RW
ATCR_EL1	0	1	1	-	n/a	RW	RW
ATCR_EL1	1	0	1	-	RW	ATCR_EL2	RW
ATCR_EL1	1	1	1	-	n/a	ATCR_EL2	RW

'n/a' Not accessible. The core cannot be executing at this Exception level, so this access is not possible.

ATCR_EL1 is also accessible using ATCR_EL12 when HCR.EL2.E2H is set. See [3.2.30 ATCR_EL12](#), *Alias to Auxiliary Translation Control Register EL1* on page 141.

Traps and enables

Rules of traps and enables for this register are the same as TCR_EL1. See the [Arm® Architecture Reference Manual for A-profile architecture](#).

3.2.29 ATCR_EL2, Auxiliary Translation Control Register, EL2

The ATCR_EL2 determines the values of PBHA on translation table walks memory access in EL2 translation regime.

Bit field descriptions

ATCR_EL2 is a 64-bit register.

Figure 3-25: ATCR_EL2 bit assignments

RES0, [63:14]

RES0

HWVAL060, [9]

Indicates the value of PBHA[1] translation table walks memory access targeting the base address defined by TTBRO_EL2 if HWEN060 is set.

HWVAL059, [8]

Indicates the value of PBHA[1] translation table walks memory access targeting the base address defined by TTBRO_EL2 if HWEN059 is set.

RES0, [7:6]

RES0	Reserved
------	----------

HWEN160, [5]

Enables PBHA[1] translation table walks memory access targeting the base address defined by TTBR1_EL2. If this bit is clear, PBHA[1] on translation table walks is 0.

HWEN159, [4]

Enables PBHA[0] translation table walks memory access targeting the base address defined by TTBR1_EL2. If this bit is clear, PBHA[0] on translation table walks is 0.

RES0, [3:2]

RES0	Reserved
------	----------

HWEN060, [1]

Enables PBHA[1] translation table walks memory access targeting the base address defined by TTBR0_EL2. If this bit is clear, PBHA[1] on translation table walks is 0.

HWEN059, [0]

Enables PBHA[0] translation table walks memory access targeting the base address defined by TTBR0_EL2. If this bit is clear, PBHA[0] on translation table walks is 0.

Configurations

AArch64 ATCR_EL2 register is architecturally mapped to AArch32 register AHTCR.

Usage constraints**Accessing the ATCR_EL2**

To access the ATCR_EL2:

```
MRS Xt, S< 3 4 c15 c7 0> ; Read ATCR_EL2 into Xt
MSR S< 3 4 c15 c7 0>, Xt ; Write Xt to ATCR_EL2
```

This syntax is encoded with the following settings in the instruction encoding:

Op0	Op1	CRn	CRm	Op2
3	4	c15	c7	0

Accessibility

ATCR_EL2 is accessible as follows:

EL0 (NS)	EL1 (NS)	EL1 (S)	EL2	EL3 (SCR.NS=1)	EL3 (SCR.NS=0)
-	-	-	RW	RW	RW

3.2.30 ATCR_EL12 , Alias to Auxiliary Translation Control Register EL1

The ATCR_EL12 alias allows access to ATCR_EL1 at EL2 or EL3 when HCR_EL2.E2H is set to 1.

Usage constraints**Accessing the ATCR_EL12**

To access the ATCR_EL1 using the ATCR_EL12 alias:

```
MRS Xt, S< 3 5 c15 c7 0> ; Read ATCR_EL12/ATCR_EL1 into Xt
MSR S< 3 5 c15 c7 0>, Xt ; Write Xt to ATCR_EL12/ATCR_EL1
```

This syntax is encoded with the following settings in the instruction encoding:

Op0	Op1	CRn	CRm	Op2
3	5	15	7	0

Accessibility

ATCR_EL12 is accessible as follows:

Name	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
ATCR_EL12	x	x	0	-	-	n/a	-
ATCR_EL12	0	0	1	-	-	-	-
ATCR_EL12	0	1	1	-	n/a	-	-
ATCR_EL12	1	0	1	-	-	ATCR_EL1	ATCR_EL1
ATCR_EL12	1	1	1	-	n/a	ATCR_EL1	ATCR_EL1

'n/a' Not accessible. The core cannot be executing at this Exception level, so this access is not possible.

Traps and enables

All traps associated with the ATCR_EL1 register that apply at EL2 or EL3 also apply to the ATCR_EL12 alias.

This alias is only accessible when HCR_EL2.E2H == 1.

When HCR_EL2.E2H == 0, access to this alias is **UNDEFINED**.

3.2.31 ATCR_EL3, Auxiliary Translation Control Register, EL3

The ATCR_EL3 determines the values of PBHA on translation table walks memory access in EL3 translation regime.

Bit field descriptions

ATCR_EL3 is a 64-bit register.

Figure 3-26: ATCR_EL3 bit assignments

RES0, [63:10]

RES0 Reserved

HWVAL60, [9]

Indicates the value of PBHA[1] translation table walks memory access if HWEN60 is set.

HWVAL59, [8]

Indicates the value of PBHA[1] translation table walks memory access if HWEN59 is set.

RES0, [7:2]

RES0 Reserved

HWEN60, [1]

Enables PBHA[1] translation table walks memory access. If this bit is clear, PBHA[1] on translation table walks is 0.

HWEN59, [0]

Enables PBHA[0] translation table walks memory access. If this bit is clear, PBHA[0] on translation table walks is 0.

Configurations

AArch64 register ATCR_EL3 is architecturally mapped to AArch32 register ATCR (S).

Usage constraints**Accessing the ATCR_EL3**

To access the ATCR_EL3:

```
MRS Xt, <3 6 c15 c7 0> ; Read ATCR_EL3 into Xt
MSR S <3 6 c15 c7 0>, Xt ; Write Xt to ATCR_EL3
```

This syntax is encoded with the following settings in the instruction encoding:

Op0	Op1	CRn	CRm	Op2
3	6	c15	c7	0

Accessibility

ATCR_EL3 is accessible as follows:

EL0	EL1 (NS)	EL1 (S)	EL2	EL3 (SCR.NS=1)	EL3 (SCR.NS=0)
-	-	-	-	RW	RW

3.2.32 AVTCR_EL2, Auxiliary Virtualized Translation Control Register, EL2

The AVTCR_EL2 determines the values of PBHA on stage 2 page table walks memory access in EL1 Non-secure translation regime if stage 2 is enable.

Bit field descriptions

AVTCR_EL2 is a 64-bit register.

Figure 3-27: AVTCR_EL2 bit assignments

RES0, [63:10]

RES0 Reserved

HWVAL60, [9]

Indicates the value of PBHA[1] page table walks memory access if HWEN60 is set.

HWVAL59, [8]

Indicates the value of PBHA[1] page table walks memory access if HWEN59 is set.

RES0, [7:2]

RES0 Reserved

HWEN60, [1]

Enables PBHA[1] page table walks memory access. If this bit is clear, PBHA[1] on page table walks is 0.

HWEN59, [0]

Enables PBHA[0] page table walks memory access. If this bit is clear, PBHA[0] on page table walks is 0.

Configurations

AArch64 register AVTCR_EL2 is architecturally mapped to AArch32 register AVTCR.

Usage constraints

Accessing the AVTCR_EL2

To access the AVTCR_EL2:

```
MRS Xt, S<3 4 c15 c7 1>; Read AVTCR_EL2 into Xt
MSR S<3 4 c15 c7 1>, Xt; Write Xt to AVTCR_EL2
```

This syntax is encoded with the following settings in the instruction encoding:

Op0	Op1	CRn	CRm	Op2
3	4	c15	c7	1

Accessibility

AVTCR_EL2 is accessible as follows:

ELO	EL1 (NS)	EL1 (S)	EL2	EL3 (SCR.NS=1)	EL3 (SCR.NS=0)
-	-	-	RW	RW	RW

3.2.33 CCSIDR_EL1, Cache Size ID Register, EL1

The CCSIDR_EL1 provides information about the architecture of the currently selected cache.

Bit field descriptions

CCSIDR_EL1 is a 64-bit register, and is part of the Identification registers functional group.

This register is read-only.

Figure 3-28: CCSIDR_EL1 bit assignments

Reserved, [63:32]

Reserved.

WT, [31]

Indicates whether the selected cache level supports Write-Through:

0 Cache Write-Through is not supported at any level.

For more information about encoding, see [CCSIDR_EL1 encodings](#) on page 147.

WB, [30]

Indicates whether the selected cache level supports Write-Back. Permitted values are:

0 Write-Back is not supported.

1 Write-Back is supported.

For more information about encoding, see [CCSIDR_EL1 encodings](#) on page 147.

RA, [29]

Indicates whether the selected cache level supports read-allocation. Permitted values are:

0 Read-allocation is not supported.

1 Read-allocation is supported.

For more information about encoding, see [CCSIDR_EL1 encodings](#) on page 147.

WA, [28]

Indicates whether the selected cache level supports write-allocation. Permitted values are:

0 Write-allocation is not supported.

1 Write-allocation is supported.

For more information about encoding, see [CCSIDR_EL1 encodings](#) on page 147.

NumSets, [27:13]

(Number of sets in cache) - 1. Therefore, a value of 0 indicates one set in the cache. The number of sets does not have to be a power of 2.

For more information about encoding, see [CCSIDR_EL1 encodings](#) on page 147.

Associativity, [12:3]

(Associativity of cache) - 1. Therefore, a value of 0 indicates an associativity of 1. The associativity does not have to be a power of 2.

For more information about encoding, see [CCSIDR_EL1 encodings](#) on page 147.

LineSize, [2:0]

(\log_2 (Number of bytes in cache line)) - 4. For example:

For a line length of 16 bytes: $\log_2(16) = 4$, LineSize entry = 0. This is the minimum line length.

For a line length of 32 bytes: $\text{Log}_2(32) = 5$, LineSize entry = 1.

For more information about encoding, see [CCSIDR_EL1 encodings](#) on page 147.

Configurations

There are no configuration notes.

Bit fields and details that are not provided in this description are architecturally defined. See the [Arm® Architecture Reference Manual for A-profile architecture](#).

CCSIDR_EL1 encodings

The following table shows the individual bit field and complete register encodings for the CCSIDR_EL1.

Table 3-47: CCSIDR encodings

CSSELR		Cache	Size	Complete register encoding	Register bit field encoding						
Level	InD				WT	WB	RA	WA	NumSets	Associativity	LineSize
0b000	0b0	L1 Data cache	64KB	701FE01A	0	1	1	1	0x00FF	0x003	2
0b000	0b1	L1 Instruction cache	64KB	201FE01A	0	0	1	0	0x00FF	0x003	2
0b001	0b0	L2 cache	256KB	703FE03A	0	1	1	1	0x01FF	0x007	2
			512KB	707FE03A	0	1	1	1	0x03FF	0x007	2
0b001	0b1	Reserved	-	-	-	-	-	-	-	-	-
0b010	0b0	L3 cache	256KB	701FE07A	0	1	1	1	000F	00F	2
			512KB	703FE07A					01FF	00F	2
			1MB	707FE07A					03FF	00F	2
			2MB	70FFE07A					07FF	00F	2
			4MB	71FFE07A					0FFF	00F	2
0b0101 - 0b1111		Reserved	-	-	-	-	-	-	-	-	-

3.2.34 CLIDR_EL1, Cache Level ID Register, EL1

The CLIDR_EL1 identifies the type of cache, or caches, implemented at each level, up to a maximum of seven levels.

It also identifies the *Level of Coherency* (LoC) and *Level of Unification* (LoU) for the cache hierarchy.

Bit field descriptions

CLIDR_EL1 is a 64-bit register, and is part of the Identification registers functional group.

This register is read-only.

Figure 3-29: CLIDR_EL1 bit assignments

RES0, [63:33]

RES0 Reserved

ICB, [32:30]

Inner cache boundary. This field indicates the boundary between the inner and the outer domain:

0b010 L2 cache is the highest inner level.

0b011 L3 cache is the highest inner level.

LoUU, [29:27]

Indicates the Level of Unification Uniprocessor for the cache hierarchy:

0b000	No levels of cache need to be cleaned or invalidated when cleaning or invalidating to the Point of Unification. This is the value if no caches are configured.
--------------	--

LoC, [26:24]

Indicates the Level of Coherency for the cache hierarchy:

0b010 L3 cache is not implemented.

0b011 L3 cache is implemented.

LoUIS, [23:21]

Indicates the *Level of Unification Inner Shareable* (LoUIS) for the cache hierarchy.

0b000 No cache level needs cleaning to Point of Unification.

RES0, [20:9]

No cache at levels L7 down to L4.

RES0 Reserved

Ctype3, [8:6]

Indicates the type of cache if the core implements L3 cache. If present, unified instruction and data caches at L3:

0b100

Both per-core L2 and cluster L3 caches are present.

0b000

All other options

Ctype2, [5:3]

Indicates the type of cache at L2:

0b100

Unified cache

Ctype1, [2:0]

Indicates the type of cache implemented at L1:

0b011

Separate instruction and data caches at L1

Configurations

There are no configuration notes.

Bit fields and details that are not provided in this description are architecturally defined. See the [Arm® Architecture Reference Manual for A-profile architecture](#).

3.2.35 CPACR_EL1, Architectural Feature Access Control Register, EL1

The CPACR_EL1 controls access to trace functionality and access to registers associated with Advanced SIMD and floating-point execution.

Bit field descriptions

CPACR_EL1 is a 64-bit register, and is part of the Other system control registers functional group.

Figure 3-30: CPACR_EL1 bit assignments

Reserved, [63:32]

Reserved

RES0, [31:29]

RES0 Reserved

TTA, [28]

Traps EL0 and EL1 System register accesses to all implemented trace registers to EL1, from both Execution states. This bit is **RES0**. The core does not provide System Register access to ETM control.

Configurations

Bit fields and details that are not provided in this description are architecturally defined. See the [Arm® Architecture Reference Manual for A-profile architecture](#).

3.2.36 CPTR_EL2, Architectural Feature Trap Register, EL2

The CPTR_EL2 controls trapping to EL2 for accesses to CPACR, trace functionality and registers associated with Advanced SIMD and floating-point execution. It also controls EL2 access to this functionality.

Bit field descriptions

CPTR_EL2 is a 64-bit register, and is part of the Virtualization registers functional group.

Figure 3-31: CPTR_EL2 bit assignments

Reserved, [63:32]

Reserved.

TTA, [20]

Trap Trace Access

This bit is not implemented. **RES0**.

Configurations

RW fields in this register reset to **UNKNOWN** values.

Bit fields and details that are not provided in this description are architecturally defined. See the [Arm® Architecture Reference Manual for A-profile architecture](#).

3.2.37 CPTR_EL3, Architectural Feature Trap Register, EL3

The CPTR_EL3 controls trapping to EL3 of access to CPACR_EL1, CPTR_EL2, trace functionality and registers associated with Advanced SIMD and floating-point execution.

It also controls EL3 access to trace functionality and registers associated with Advanced SIMD and floating-point execution.

Bit field descriptions

CPTR_EL3 is a 64-bit register, and is part of the Security registers functional group.

Figure 3-32: CPTR_EL3 bit assignments

Reserved, [63:32]

Reserved.

TTA, [20]

Trap Trace Access

Not implemented. **RES0**.

TFP, [10]

Traps all accesses to SVE, Advanced SIMD and floating-point functionality to EL3. This applies to all Exception levels, both Security states, and both Execution states. The possible values are:

- | | |
|---|---|
| 0 | Does not cause any instruction to be trapped. This is the reset value. |
| 1 | Any attempt at any Exception level to execute an instruction that uses the registers that are associated with SVE, Advanced SIMD and floating-point is trapped to EL3, subject to the exception prioritization rules. |

Configurations

There are no configuration notes.

Bit fields and details that are not provided in this description are architecturally defined. See the [Arm® Architecture Reference Manual for A-profile architecture](#).

3.2.38 CPUACTLR_EL1, CPU Auxiliary Control Register, EL1

The CPUACTLR_EL1 provides **IMPLEMENTATION DEFINED** configuration and control options for the core.

Bit field descriptions

CPUACTLR_EL1 is a 64-bit register, and is part of the **IMPLEMENTATION DEFINED** registers functional group.

Figure 3-33: CPUACTLR_EL1 bit assignments

Reserved, [63:0]

Reserved for Arm® internal use.

Configurations

CPUACTLR_EL1 is common to the Secure and Non-secure states.

Usage constraints

Accessing the CPUACTLR_EL1

The CPU Auxiliary Control Register can be written only when the system is idle. Arm recommends that you write to this register after a powerup reset, before the MMU is enabled.

Setting many of these bits can cause significantly lower performance on your code. Therefore, Arm strongly recommends that you do not modify this register unless directed by Arm.

This register is accessible as follows:

This register can be read with the MRS instruction using the following syntax:

```
MRS <Xt>, <systemreg>
```

This register can be written with the MSR instruction using the following syntax:

```
MSR <systemreg>, <Xt>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
S3_0_C15_C1_0	11	000	1111	0001	000

Accessibility

This register is accessible in software as follows:

<systemreg>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
S3_0_C15_C1_0	x	x	0	-	RW	n/a	RW
S3_0_C15_C1_0	x	0	1	-	RW	RW	RW
S3_0_C15_C1_0	x	1	1	-	n/a	RW	RW

'n/a' Not accessible. The core cannot be executing at this Exception level, so this access is not possible.

Traps and enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization* in the [Arm® Architecture Reference Manual for A-profile architecture](#).

3.2.39 CPUACTLR2_EL1, CPU Auxiliary Control Register 2, EL1

The CPUACTLR2_EL1 provides **IMPLEMENTATION DEFINED** configuration and control options for the core.

Bit field descriptions

CPUACTLR2_EL1 is a 64-bit register, and is part of the **IMPLEMENTATION DEFINED** registers functional group.

Figure 3-34: CPUACTLR2_EL1 bit assignments

Reserved, [63:0]

Reserved for Arm® internal use.

Configurations

CPUACTLR2_EL1 is common to the Secure and Non-secure states.

Usage constraints

Accessing the CPUACTLR2_EL1

The CPUACTLR2_EL1 can be written only when the system is idle. Arm recommends that you write to this register after a powerup reset, before the MMU is enabled.

Setting many of these bits can cause significantly lower performance on your code. Therefore, Arm strongly recommends that you do not modify this register unless directed by Arm.

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This register can be written using MSR with the following syntax:

```
MSR <systemreg>, <Xt>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	Op0	Op1	CRn	CRm	Op2
S3_0_C15_C1_1	11	000	1111	0001	001

Accessibility

This register is accessible in software as follows:

<syntax>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
S3_0_C15_C1_1	x	x	0	-	RW	n/a	RW
S3_0_C15_C1_1	x	0	1	-	RW	RW	RW
S3_0_C15_C1_1	x	1	1	-	n/a	RW	RW

'n/a' Not accessible. The PE cannot be executing at this Exception level, so this access is not possible.

Traps and enables

For a description of the prioritization of any generated exceptions, see *Exception priority order* in the [Arm® Architecture Reference Manual for A-profile architecture](#) for exceptions taken to AArch64 state, and see *Synchronous exception prioritization* for exceptions taken to AArch64 state.

Write-Access to this register from EL1 or EL2 depends on the value of bit[0] of ACTLR_EL2 and ACTLR_EL3.

3.2.40 CPUACTLR3_EL1, CPU Auxiliary Control Register 3, EL1

The CPUACTLR3_EL1 provides **IMPLEMENTATION DEFINED** configuration and control options for the core.

Bit field descriptions

CPUACTLR3_EL1 is a 64-bit register, and is part of the **IMPLEMENTATION DEFINED** registers functional group.

Figure 3-35: CPUACTLR3_EL1 bit assignments

Reserved, [63:0]

Reserved for Arm® internal use.

Configurations

CPUACTLR3_EL1 is common to the Secure and Non-secure states.

Usage constraints

Accessing the CPUACTLR3_EL1

The CPUACTLR3_EL1 can be written only when the system is idle. Arm recommends that you write to this register after a powerup reset, before the MMU is enabled.

Setting many of these bits can cause significantly lower performance on your code. Therefore, Arm strongly recommends that you do not modify this register unless directed by Arm.

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This register can be written using MSR with the following syntax:

```
MSR <systemreg>, <Xt>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	Op0	Op1	CRn	CRm	Op2
S3_O_C15_C1_2	11	000	1111	0001	010

Accessibility

This register is accessible in software as follows:

<syntax>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
S3_O_C15_C1_2	x	x	0	-	RW	n/a	RW
S3_O_C15_C1_2	x	0	1	-	RW	RW	RW
S3_O_C15_C1_2	x	1	1	-	n/a	RW	RW

'n/a' Not accessible. The PE cannot be executing at this Exception level, so this access is not possible.

Traps and enables

For a description of the prioritization of any generated exceptions, see *Exception priority order* in the [Arm® Architecture Reference Manual for A-profile architecture](#) for exceptions taken to AArch64 state, and see *Synchronous exception prioritization* for exceptions taken to AArch64 state.

Write-Access to this register from EL1 or EL2 depends on the value of bit[0] of ACTLR_EL2 and ACTLR_EL3.

3.2.41 CPUACTLR5_EL1, CPU Auxiliary Control Register 5, EL1

The CPUACTLR5_EL1 provides **IMPLEMENTATION DEFINED** configuration and control options for the core.

Bit field descriptions

CPUACTLR5_EL1 is a 64-bit register, and is part of the **IMPLEMENTATION DEFINED** registers functional group.

Figure 3-36: CPUACTLR5_EL1 bit assignments

Reserved, [63:0]

Reserved for Arm® internal use.

Configurations

CPUACTLR5_EL1 is common to the Secure and Non-secure states.

Usage constraints

Accessing the CPUACTLR5_EL1

The CPUACTLR5_EL1 can be written only when the system is idle. Arm recommends that you write to this register after a powerup reset, before the MMU is enabled.

Setting many of these bits can cause significantly lower performance on your code. Therefore, Arm strongly recommends that you do not modify this register unless directed by Arm.

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This register can be written using MSR with the following syntax:

```
MSR <systemreg>, <Xt>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	Op0	Op1	CRn	CRm	Op2
S3_0_C15_C9_0	11	000	1111	1001	000

Accessibility

This register is accessible in software as follows:

<syntax>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
S3_0_C15_C9_0	x	x	0	-	RW	n/a	RW
S3_0_C15_C9_0	x	0	1	-	RW	RW	RW
S3_0_C15_C9_0	x	1	1	-	n/a	RW	RW

'n/a' Not accessible. The PE cannot be executing at this Exception level, so this access is not possible.

Traps and enables

For a description of the prioritization of any generated exceptions, see *Exception priority order* in the [Arm® Architecture Reference Manual for A-profile architecture](#) for exceptions taken to AArch64 state, and see *Synchronous exception prioritization* for exceptions taken to AArch64 state.

Write-Access to this register from EL1 or EL2 depends on the value of bit[0] of ACTLR_EL2 and ACTLR_EL3.

3.2.42 CPUACTLR6_EL1, CPU Auxiliary Control Register 6, EL1

The CPUACTLR6_EL1 provides **IMPLEMENTATION DEFINED** configuration and control options for the core.

Bit field descriptions

CPUACTLR6_EL1 is a 64-bit register, and is part of the **IMPLEMENTATION DEFINED** registers functional group.

Figure 3-37: CPUACTLR6_EL1 bit assignments

Reserved, [63:0]

Reserved for Arm® internal use.

Configurations

CPUACTLR6_EL1 is common to the Secure and Non-secure states.

Usage constraints

Accessing the CPUACTLR6_EL1

The CPUACTLR6_EL1 can be written only when the system is idle. Arm recommends that you write to this register after a powerup reset, before the MMU is enabled.

Setting many of these bits can cause significantly lower performance on your code. Therefore, Arm strongly recommends that you do not modify this register unless directed by Arm.

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This register can be written using MSR with the following syntax:

```
MSR <systemreg>, <Xt>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	Op0	Op1	CRn	CRm	Op2
S3_O_C15_C9_1	11	000	1111	1001	001

Accessibility

This register is accessible in software as follows:

<syntax>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
S3_0_C15_C9_1	x	x	0	-	RW	n/a	RW
S3_0_C15_C9_1	x	0	1	-	RW	RW	RW
S3_0_C15_C9_1	x	1	1	-	n/a	RW	RW

'n/a' Not accessible. The PE cannot be executing at this Exception level, so this access is not possible.

Traps and enables

For a description of the prioritization of any generated exceptions, see *Exception priority order* in the [Arm® Architecture Reference Manual for A-profile architecture](#) for exceptions taken to AArch64 state, and see *Synchronous exception prioritization* for exceptions taken to AArch64 state.

Write-Access to this register from EL1 or EL2 depends on the value of bit[0] of ACTLR_EL2 and ACTLR_EL3.

3.2.43 CPUCLLCTLR_EL1, Cache Line Lockout Control Register, EL1

CPUCLLCTLR_EL1 is the global control register for the Cache Line Lockout functions.

Bit field descriptions

CPUCLLCTLR_EL1 is a 64-bit register:

Figure 3-38: CPUCLLCTLR_EL1 bit assignments

RES0, [63:2]

RES0 Reserved.

CPUCLL1_EN, [1]

Reset to 0. If 1, CPUCLL1 is active.

CPUCLL0_EN, [0]

Reset to 0. If 1, CPUCLL0 is active.

Configurations

When CPUCLLCTLR_EL1[0] or [1] are set, then the corresponding CPUCLL<n>_EL1 register is used to lock the specified Set and Way of the Unit. This register must be programmed before caches are enabled.

Usage constraints

Accessing CPUCLLCTLR_EL1

Register access is encoded as follows:

Table 3-58: CPUCLLCTLR_EL1 encoding

<systemreg>	op0	op1	CRn	CRm	op2
S3_O_C15_C9_4	11	000	1111	1001	100

Accessibility

This register is accessible in software as follows:

<systemreg>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
S3_O_C15_C9_4	x	x	0	-	RW	n/a	RW
S3_O_C15_C9_4	x	0	1	-	RW	RW	RW
S3_O_C15_C9_4	x	1	1	-	n/a	RW	RW

Write access to this register from all exception levels depends on the state of the caches: bit [2] of the SCTLR_EL3, SCTLR_EL2, and SCTLR_EL3 registers and bit [12] of the HCR_EL2 register must all be 0 for write access. Write access to this register from EL1 or EL2 also depends on the value of bit[6] of the ACTLR_EL2 and ACTLR_EL3 registers.

3.2.44 CPUCLLO_EL1, CPU Cache Line Lockout Register, EL1

The CPUCLLO_EL1 provides **IMPLEMENTATION DEFINED** configuration and control options for EL1.

Bit field descriptions

CPUCLLO_EL1 is a 64-bit register:

Figure 3-39: CPUCLLO_EL1 bit assignments

See [3.3.5 ERRORMISCO, Error Record Miscellaneous Register 0](#) on page 291 for full bit field descriptions.

Not all bit fields for ERRORMISCO are present in CPUCLLO.

Usage constraints

Accessing CPUCLLO_EL1

Register access is encoded as follows:

Table 3-60: CPUCLLO_EL1 encoding

<systemreg>	op0	op1	CRn	CRm	op2
S3_0_C15_C10_0	11	000	1111	1010	000

Accessibility

This register is accessible in software as follows:

<systemreg>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
S3_0_C15_C10_0	x	x	0	-	RW	n/a	RW
S3_0_C15_C10_0	x	0	1	-	RW	RW	RW
S3_0_C15_C10_0	x	1	1	-	n/a	RW	RW

Write access to this register from all exception levels depends on the state of the caches: bit [2] of the SCTLR_EL3, SCTLR_EL2, and SCTLR_EL3 registers and bit [12] of the HCR_EL2 register must all be 0 for write access. Write access to this register from EL1 or EL2 also depends on the value of bit[6] of the ACTLR_EL2 and ACTLR_EL3 registers.

3.2.45 CPUCLL1_EL1, CPU Cache Line Lockout Register, EL1

The CPUCLL1_EL1 provides **IMPLEMENTATION DEFINED** configuration and control options for EL1.

Bit field descriptions

CPUCLL1_EL1 is a 64-bit register:

Figure 3-40: CPUCLL1_EL1 bit assignments

See [3.3.5 ERRORMISCO, Error Record Miscellaneous Register 0](#) on page 291 for full bit field descriptions.

Not all bit fields for ERRORMISCO are present in CPUCLL1.

Usage constraints

Accessing CPUCLL1_EL1

Register access is encoded as follows:

Table 3-62: CPUCLL1_EL1 encoding

<systemreg>	op0	op1	CRn	CRm	op2
S3_O_C15_C10_1	11	000	1111	1010	001

Accessibility

This register is accessible in software as follows:

<systemreg>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
S3_O_C15_C10_1	x	x	0	-	RW	n/a	RW
S3_O_C15_C10_1	x	0	1	-	RW	RW	RW
S3_O_C15_C10_1	x	1	1	-	n/a	RW	RW

Write access to this register from all exception levels depends on the state of the caches: bit [2] of the SCTLR_EL3, SCTLR_EL2, and SCTLR_EL3 registers and bit [12] of the HCR_EL2 register must all be 0 for write access. Write access to this register from EL1 or EL2 also depends on the value of bit[6] of the ACTLR_EL2 and ACTLR_EL3 registers.

3.2.46 CPUCFR_EL1, CPU Configuration Register, EL1

The CPUCFR_EL1 provides configuration information for the core.

Bit field descriptions

CPUCFR_EL1 is a 64-bit register, and is part of the **IMPLEMENTATION DEFINED** registers functional group.

This register is read-only.

Figure 3-41: CPUCFR_EL1 bit assignments

RES0, [63:32]

Reserved

RES0, [31:2]

RES0 Reserved

ECC, [1:0]

Indicates whether ECC is present or not. The possible values are:

- | | |
|----|---------------------|
| 00 | ECC is not present. |
| 01 | ECC is present. |

Configurations

There are no configuration notes.

Bit fields and details that are not provided in this description are architecturally defined. See the [Arm® Architecture Reference Manual for A-profile architecture](#).

Usage constraints

Accessing the CPUCFR_EL1

This register can be read with the MRS instruction using the following syntax:

```
MRS <Xt>, <systemreg>
```

To access the CPUCFR_EL1:

```
MRS <Xt>, CPUCFR_EL1 ; Read CPUCFR_EL1 into Xt
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
S3_0_C15_CO_0	11	000	1111	0000	000

Accessibility

This register is accessible in software as follows:

<systemreg>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
S3_0_C15_CO_0	x	x	0	-	RO	n/a	RO
S3_0_C15_CO_0	x	0	1	-	RO	RO	RO
S3_0_C15_CO_0	x	1	1	-	n/a	RO	RO

'n/a' Not accessible. The PE cannot be executing at this Exception level, so this access is not possible.

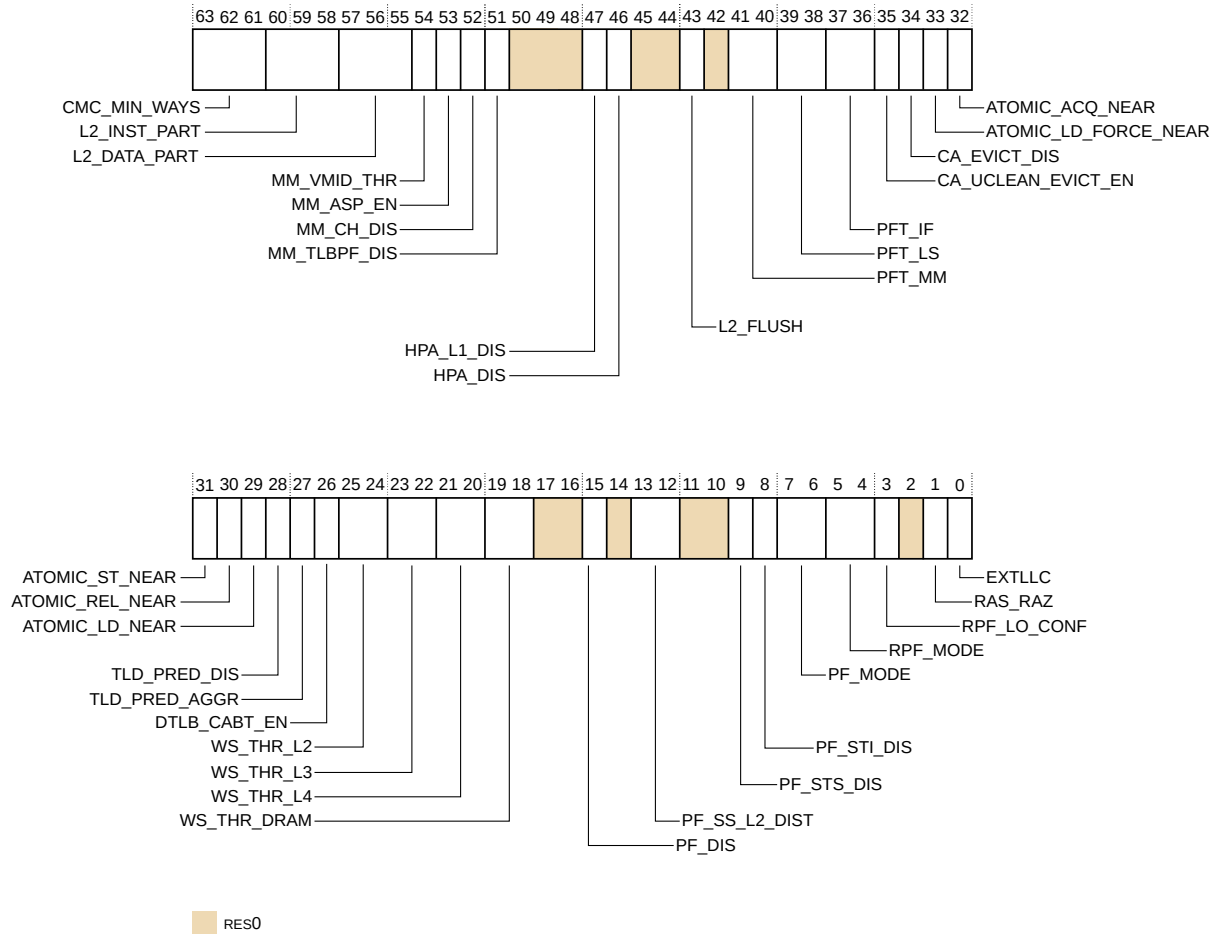

3.2.47 CPUECTLR_EL1, CPU Extended Control Register, EL1

The CPUECTLR_EL1 provides additional **IMPLEMENTATION DEFINED** configuration and control options for the core.

Bit field descriptions

CPUECTLR_EL1 is a 64-bit register, and is part of the 64-bit registers functional group.

This register resets to value 0xA000000B40543000.

Figure 3-42: CPUECTLR_EL1 bit assignments**CMC_MIN_WAYS, [63:61]**

Limits how many ways of L2 can be used by *Correlated Miss Caching* (CMC) data prefetcher. The possible values are:

000	CMC disabled
001	Reserved
010	Reserved
011	Reserved
100	Reserved
101	CMC must leave at least 5 ways for data in L2. This is the reset value.
110	CMC must leave at least 6 ways for data in L2.
111	CMC must leave at least 7 ways for data in L2.

L2_INST_PART, [60:58]

Partition the L2 cache for instruction.⁵ The possible values are:

000	No ways reserved for instruction. This is the reset value.
001	Reserve 1 way for instructions. Only instruction fetches can allocate way [7].
010	Reserve 2 ways for instructions. Only instruction fetches can allocate ways [7:6].
011	Reserve 3 ways for instructions. Only instruction fetches can allocate ways [7:5].
100	Reserve 4 ways for instructions. Only instruction fetches can allocate ways [7:4].
101	Reserve 5 ways for instructions. Only instruction fetches can allocate ways [7:3].
110	Reserve 6 ways for instructions. Only instruction fetches can allocate ways [7:2].
111	Reserve 7 ways for instructions. Only instruction fetches can allocate ways [7:1].

L2_DATA_PART, [57:55]

Partition the L2 cache for data.⁵ The possible values are:

000	No ways reserved for data. This is the reset value.
001	Reserve 1 way for data. Only data accesses can allocate way [0].
010	Reserve 2 ways for data. Only data accesses can allocate ways [1:0].
011	Reserve 3 ways for data. Only data accesses can allocate ways [2:0].
100	Reserve 4 ways for data. Only data accesses can allocate ways [3:0].
101	Reserve 5 ways for data. Only data accesses can allocate ways [4:0].
110	Reserve 6 ways for data. Only data accesses can allocate ways [5:0].
111	Reserve 7 ways for data. Only data accesses can allocate ways [6:0].

MM_VMID_THR, [54]

VMID filter threshold. The possible values are:

0	Flush VMID filter after 16 unique VMID allocations to the <i>Memory Management Unit</i> (MMU) Translation Cache. This is the reset value.
1	Flush VMID filter after 32 unique VMID allocations to the MMU Translation Cache.

MM_ASP_EN, [53]

Disables allocation of splintered pages in L2 TLB. The possible values are:

0	Enables allocation of splintered pages in the L2 TLB. This is the reset value.
----------	--

⁵ If any ways are left unselected by the settings of L2_INST_PART and L2_DATA_PART, then those ways can be used for either instruction or data allocation. If any ways selected by the settings of L2_INST_PART and L2_DATA_PART overlap, then those ways will not be used for either instruction or data allocation.

1 Disables allocation of splintered pages in the L2 TLB.

MM_CH_DIS, [52]

Disables use of contiguous hint. The possible values are:

0 Enables use of contiguous hint. This is the reset value.
1 Disables use of contiguous hint.

MM_TLBPF_DIS, [51]

Disables L2 TLB prefetcher. The possible values are:

0 Enables L2 TLB prefetcher. This is the reset value.
1 Disables L2 TLB prefetcher.

RES0, [50:48]

RES0 Reserved

HPA_L1_DIS, [47]

Disables HPA in L1 TLBs (but continues to use HPA in L2 TLB). The possible values are:

0 Enables hardware page aggregation in L1 TLBs. This is the reset value.
1 Disables hardware page aggregation in L1 TLBs.

HPA_DIS, [46]

Disables hardware page aggregation. The possible values are:

0 Enables hardware page aggregation. This is the reset value.
1 Disables hardware page aggregation.

RES0, [45:44]

RES0 Reserved

L2_FLUSH, [43]

Allocation behavior of copybacks caused by L2 cache hardware flush and DC CISC instructions targeting the L2 cache. If it is known that data is likely to be used soon by another core, setting this bit can improve system performance. The possible values are:

0 L2 cache flushes and invalidates by set/way do not allocate in the L3 cache. Cache lines in the UniqueDirty state cause WriteBack transactions with the allocation hint cleared, while cache lines in UniqueClean or SharedClean states cause address-only Evict transactions. This is the reset value.
1 L2 cache flushes by set/way allocate in the L3 cache. Cache lines in the UniqueDirty or UniqueClean state cause WriteBackFull or WriteEvictFull transactions, respectively, both with the allocation hint

set. Cache lines in the SharedClean state cause address-only Evict transactions.

RES0, [42]

RES0	Reserved
-------------	----------

PFT_MM, [41:40]

DRAM prefetch using PrefetchTgt transactions for table walk requests. The possible values are:

00	Disable PrefetchTgt generation for requests from the MMU. This is the reset value.
01	Conservatively generate PrefetchTgt for cacheable requests from the MMU, always generate for Non-cacheable.
10	Aggressively generate PrefetchTgt for cacheable requests from the MMU, always generate for Non-cacheable.
11	Always generate PrefetchTgt for cacheable requests from the MMU, always generate for Non-cacheable.

PFT_LS, [39:38]

DRAM prefetch using PrefetchTgt transactions for load and store requests. The possible values are:

00	Disable PrefetchTgt generation for requests from the Load-Store unit (LS). This is the reset value.
01	Conservatively generate PrefetchTgt for cacheable requests from the LS, always generate for Non-cacheable.
10	Aggressively generate PrefetchTgt for cacheable requests from the LS, always generate for Non-cacheable.
11	Always generate PrefetchTgt for cacheable requests from the LS, always generate for Non-cacheable.

PFT_IF, [37:36]

DRAM prefetch using PrefetchTgt transactions for instruction fetch requests. The possible values are:

00	Disable PrefetchTgt generation for requests from the Instruction Fetch unit (IF). This is the reset value.
01	Conservatively generate PrefetchTgt for cacheable requests from the IF, always generate for Non-cacheable.
10	Aggressively generate PrefetchTgt for cacheable requests from the IF, always generate for Non-cacheable.
11	Always generate PrefetchTgt for cacheable requests from the IF, always generate for Non-cacheable.

CA_UCLEAN_EVICT_EN, [35]

Enables sending WriteEvict transactions on the CPU CHI interface for UniqueClean evictions. WriteEvict transactions update downstream caches. Enable WriteEvict transactions only if there is an additional level of cache below the CPU's L2 cache. The possible values are:

- | | |
|----------|---|
| 0 | Disables sending data with UniqueClean evictions. |
| 1 | Enables sending data with UniqueClean evictions. This is the reset value. |

CA_EVICT_DIS, [34]

Disables sending of Evict transactions on the CPU CHI interface for clean cache lines that are evicted from the core. Evict transactions are required only if the system contains a snoop filter that requires notification when the core evicts the cache line. The possible values are:

- | | |
|----------|--|
| 0 | Enables sending Evict transactions. This is the reset value. |
| 1 | Disables sending Evict transactions. |

ATOMIC_LD_FORCE_NEAR, [33]

A load atomic (including SWP and CAS) instruction to WB memory will be performed near. The possible values are:

- | | |
|----------|--|
| 0 | Load-atomic is near if cache line is already exclusive, otherwise make far atomic request. |
| 1 | Load-atomic will be performed near by bringing the line into the L1D Cache. This is the reset value. |

ATOMIC_ACQ_NEAR, [32]

An atomic instruction to WB memory with acquire semantics that does not hit in the cache in Exclusive state, may make up to one fill request. The possible values are:

- | | |
|----------|---|
| 0 | Acquire-atomic is near if cache line is already Exclusive, otherwise make far atomic request. |
| 1 | Acquire-atomic will make up to 1 fill request to perform near. This is the reset value. |

ATOMIC_ST_NEAR, [31]

A store atomic instruction to WB memory that does not hit in the cache in Exclusive state, may make up to one fill request. The possible values are:

- | | |
|----------|--|
| 0 | Store-atomic is near if cache line is already Exclusive, otherwise make far atomic request. This is the reset value. |
| 1 | Store-atomic will make up to 1 fill request to perform near. |

ATOMIC_REL_NEAR, [30]

An atomic instruction to WB memory with release semantics that does not hit in the cache in Exclusive state, may make up to one fill request. The possible values are:

- | | |
|----------|---|
| 0 | Release-atomic is near if cache line is already Exclusive, otherwise make far atomic request. |
| 1 | Release-atomic will make up to 1 fill request to perform near. This is the reset value. |

ATOMIC_LD_NEAR, [29]

A load atomic (including SWP and CAS) instruction to WB memory that does not hit in the cache in Exclusive state, may make up to one fill request. The possible values are:

- | | |
|----------|---|
| 0 | Load-atomic is near if cache line is already Exclusive, otherwise make far atomic request. This is the reset value. |
| 1 | Load-atomic will make up to 1 fill request to perform near. |

TLD_PRED_DIS, [28]

Disables Transient Load Prediction. The possible values are:

- | | |
|----------|---|
| 0 | Enables transient load prediction. This is the reset value. |
| 1 | Disables transient load prediction. |

TLD_PRED_AGGR, [27]

Enables aggressive transient load prediction. The possible values are:

- | | |
|----------|--|
| 0 | Transient load prediction uses more conservative threshold. This is the reset value. |
| 1 | Transient load prediction uses more aggressive threshold. |

DTLB_CABT_EN, [26]

Enables TLB Conflict Data Abort Exception. The possible values are:

- | | |
|----------|--|
| 0 | Disables TLB conflict data abort exception. This is the reset value. |
| 1 | Enables TLB conflict data abort exception. |

WS_THR_L2, [25:24]

Threshold for direct stream to L2 cache on store. The possible values are:

- | | |
|-----------|--|
| 00 | 256B. This is the reset value. |
| 01 | 4KB |
| 10 | 8KB |
| 11 | Disables direct stream to L2 cache on store. |

WS_THR_L3, [23:22]

Threshold for direct stream to L3 cache on store. Once the threshold is met, consecutive streaming writes will not allocate in the L1 or L2 cache. The possible values are:

- | | |
|-----------|--|
| 00 | 128KB |
| 01 | 256KB. This is the reset value. |
| 10 | 512KB |
| 11 | Disables direct stream to L3 cache on store. |

WS_THR_L4, [21:20]

Threshold for direct stream to L4 cache on store. Once the threshold is met, consecutive streaming writes will not allocate in the L1, L2, or L3 cache. ⁶ The possible values are:

00	256KB
01	512KB. This is the reset value.
10	1MB
11	Disables direct stream to L4 cache on store.

WS_THR_DRAM, [19:18]

Threshold for direct stream to DRAM on store. ⁶ The possible values are:

00	512KB
01	1MB. This is the reset value.
10	2MB
11	Disables direct stream to DRAM on store.

RES0, [17:16]

RES0	Reserved
-------------	----------

PF_DIS, [15]

Disables data-side hardware prefetching. The possible values are:

0	Enables hardware prefetching. This is the reset value.
1	Disables hardware prefetching.

RES0, [14]

RES0	Reserved
-------------	----------

PF_SS_L2_DIST, [13:12]

Single cache line stride prefetching L2 distance. The possible values are:

00	22
01	40
10	60
11	Dynamically managed by hardware. This is the reset value.

RES0, [11:10]

RES0	Reserved
-------------	----------

PF_STS_DIS, [9]

Disable store-stride prefetches. The possible values are:

⁶ If the PE detects that it is the only active requestor in the DSU-AE cluster, then it may scale these to larger thresholds.

0	Enables store prefetching. This is the reset value.
1	Disables store prefetching.

PF_STI_DIS, [8]

Disables store prefetches at issue. The possible values are:

0	Enables store prefetching. This is the reset value.
1	Disables store prefetching.

PF_MODE, [7:6]

General prefetcher aggressibility. The possible values are:

00	Dynamic aggressiveness. This is the reset value.
01	Conservative prefetching
10	Very conservative prefetching
11	Most conservative prefetching

RPF_MODE, [5:4]

Region prefetcher aggressibility. The possible values are:

00	Dynamic region prefetch aggressiveness. This is the reset value.
01	Conservative region prefetching
10	Very conservative region prefetching
11	Most conservative region prefetching. This will disable the region prefetcher.

RPF_LO_CONF, [3]

Region prefetcher single accesses training behavior. The possible values are:

0	Limited training for PHT on single accesses. This is the reset value.
1	Always train the PHT on single accesses, which results in fewer prefetch requests.

RES0, [2]

Forces reads of Reliability, Availability, and Serviceability (RAS) error record registers to Read-As-Zero instead of the current value in the register. The possible values are:

RES0	Reserved
-------------	----------

RAS_RAZ, [1]

0	Reads of RAS error record registers return current values.
1	Reads of RAS error record registers return zero.

In Lock-mode, set this bit to 1 to avoid divergence if software attempts to read RAS registers.

EXTLLC, [0]

Internal or external Last-level cache (LLC) in the system. The possible values are:

- 0** Indicates that an internal Last-level cache is present in the system, and that the DataSource field on the master CHI interface indicates when data is returned from the LLC. This is used to control how the LL_CACHE* PMU events count. This is the reset value.
- 1** Indicates that an external Last-level cache is present in the system, and that the DataSource field on the master CHI interface indicates when data is returned from the LLC. This is used to control how the LL_CACHE* PMU events count.

Configurations

This register has no configuration options.

Usage constraints

Accessing the CPUECTLR_EL1

The CPU Extended Control Register can be written only when the system is idle. Arm recommends that you write to this register after a powerup reset, before the MMU is enabled.

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This register can be written using MSR with the following syntax:

```
MSR <systemreg>, <Xt>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
CPUECTLR_EL1	11	000	1111	0001	100

Accessibility

This register is accessible in software as follows:

<systemreg>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
CPUECTLR_EL1	x	x	0	-	RW	n/a	RW

<systemreg>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
CPUECTLR_EL1	x	0	1	-	RW	RW	RW
CPUECTLR_EL1	x	1	1	-	n/a	RW	RW

'n/a' Not accessible. The PE cannot be executing at this Exception level, so this access is not possible.

Traps and enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization* in the [Arm® Architecture Reference Manual for A-profile architecture](#) for exceptions taken to AArch64 state.

Access to this register depends on bit[1] of ACTLR_EL2 and ACTLR_EL3.

3.2.48 CPUECTLR2_EL1, CPU Extended Control Register2, EL1

The CPUECTLR2_EL1 provides additional **IMPLEMENTATION DEFINED** configuration and control options for the core.

Bit field descriptions

CPUECTLR2_EL1 is a 64-bit register, and is part of the 64-bit registers functional group.

This register resets to value 0x0000000000000000.

Note

When partitioning the L2 via CPUECTLR2_EL1, you must consider the effect of cache-line locking. For example, if seven out of eight ways are partitioned for data, and the only available way for instruction is locked for a given set, there are no available ways for an instruction miss to allocate.

This register is accessible in software as follows:

<systemreg>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
CPUECTLR2_EL1	x	x	0	-	RW	n/a	RW
CPUECTLR2_EL1	x	0	1	-	RW	RW	RW
CPUECTLR2_EL1	x	1	1	-	n/a	RW	RW

'n/a' Not accessible. The PE cannot be executing at this Exception level, so this access is not possible.

Traps and enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization* in the [Arm® Architecture Reference Manual for A-profile architecture](#) for exceptions taken to AArch64 state.

Access to this register depends on bit[1] of ACTLR_EL2 and ACTLR_EL3.

3.2.49 CPUPCR_EL3, CPU Private Control Register, EL3

The CPUPCR_EL3 provides **IMPLEMENTATION DEFINED** configuration and control options for the core.

Bit field descriptions

CPUPCR_EL3 is a 64-bit register, and is part of the **IMPLEMENTATION DEFINED** registers functional group.

Figure 3-44: CPUPCR_EL3 bit assignments

Reserved, [63:0]

Reserved for Arm® internal use.

Configurations

CPUPCR_EL3 is only accessible in Secure state.

Usage constraints

Accessing the CPUPCR_EL3

The CPUPCR_EL3 can be written only when the system is idle. Arm recommends that you write to this register after a powerup reset, before the MMU is enabled.

Writing to this register might cause **UNPREDICTABLE** behaviors. Therefore, Arm strongly recommends that you do not modify this register unless directed by Arm.

This register is accessible as follows:

This register can be read with the MRS instruction using the following syntax:

```
MRS <Xt>, <systemreg>
```

This register can be written with the MSR instruction using the following syntax:

```
MSR <systemreg>, <Xt>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2

Accessibility

This register is accessible in software as follows:

<systemreg>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
S3_6_C15_8_3	x	x	0	-	-	n/a	RW
S3_6_C15_8_3	x	0	1	-	-	-	RW
S3_6_C15_8_3	x	1	1	-	n/a	-	RW

'n/a' Not accessible. The core cannot be executing at this Exception level, so this access is not possible.

Traps and enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization* in the [Arm® Architecture Reference Manual for A-profile architecture](#).

3.2.52 CPUPMR2_EL3, CPU Private Mask Register 2, EL3

The CPUPMR2_EL3 provides **IMPLEMENTATION DEFINED** configuration and control options for the core.

Bit field descriptions

CPUPMR2_EL3 is a 64-bit register, and is part of the **IMPLEMENTATION DEFINED** registers functional group.

Figure 3-47: CPUPMR2_EL3 bit assignments

Reserved, [63:0]

Reserved for Arm® internal use.

Configurations

CPUPMR2_EL3 is only accessible in Secure state.

Usage constraints

Accessing the CPUPMR2_EL3

The CPUPMR2_EL3 can be written only when the system is idle. Arm recommends that you write to this register after a powerup reset, before the MMU is enabled.

Writing to this register might cause **UNPREDICTABLE** behaviors. Therefore, Arm strongly recommends that you do not modify this register unless directed by Arm.

This register is accessible as follows:

This register can be read with the MRS instruction using the following syntax:

```
MRS <Xt>, <systemreg>
```

This register can be written with the MSR instruction using the following syntax:

```
MSR <systemreg>, <Xt>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
S3_6_C15_8_5	11	110	1111	1000	011

Accessibility

This register is accessible in software as follows:

<systemreg>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
S3_6_C15_8_5	x	x	0	-	-	n/a	RW
S3_6_C15_8_5	x	0	1	-	-	-	RW
S3_6_C15_8_5	x	1	1	-	n/a	-	RW

'n/a' Not accessible. The core cannot be executing at this Exception level, so this access is not possible.

Traps and enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization* in the [Arm® Architecture Reference Manual for A-profile architecture](#).

3.2.53 CPUPOR_EL3, CPU Private Operation Register, EL3

The CPUPOR_EL3 provides **IMPLEMENTATION DEFINED** configuration and control options for the core.

Bit field descriptions

CPUPOR_EL3 is a 64-bit register, and is part of the **IMPLEMENTATION DEFINED** registers functional group.

Figure 3-48: CPUPOR_EL3 bit assignments

Reserved, [63:0]

Reserved for Arm® internal use.

Configurations

CPUPOR_EL3 is only accessible in Secure state.

Usage constraints

Accessing the CPUPOR_EL3

The CPUPOR_EL3 can be written only when the system is idle. Arm recommends that you write to this register after a powerup reset, before the MMU is enabled.

Writing to this register might cause **UNPREDICTABLE** behaviors. Therefore, Arm strongly recommends that you do not modify this register unless directed by Arm.

This register is accessible as follows:

This register can be read with the MRS instruction using the following syntax:

```
MRS <Xt>, <systemreg>
```

This register can be written with the MSR instruction using the following syntax:

```
MSR <systemreg>, <Xt>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
S3_6_C15_8_2	11	110	1111	1000	010

Accessibility

This register is accessible in software as follows:

<systemreg>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
S3_6_C15_8_2	x	x	0	-	-	n/a	RW
S3_6_C15_8_2	x	0	1	-	-	-	RW
S3_6_C15_8_2	x	1	1	-	n/a	-	RW

'n/a' Not accessible. The core cannot be executing at this Exception level, so this access is not possible.

Traps and enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization* in the [Arm® Architecture Reference Manual for A-profile architecture](#).

3.2.54 CPUPOR2_EL3, CPU Private Operation Register 2, EL3

The CPUPOR2_EL3 provides **IMPLEMENTATION DEFINED** configuration and control options for the core.

Bit field descriptions

CPUPOR2_EL3 is a 64-bit register, and is part of the **IMPLEMENTATION DEFINED** registers functional group.

Figure 3-49: CPUPOR2_EL3 bit assignments

Reserved, [63:0]

Reserved for Arm® internal use.

Configurations

CPUPOR2_EL3 is only accessible in Secure state.

Usage constraints

Accessing the CPUPOR2_EL3

The CPUPOR2_EL3 can be written only when the system is idle. Arm recommends that you write to this register after a powerup reset, before the MMU is enabled.

Writing to this register might cause **UNPREDICTABLE** behaviors. Therefore, Arm strongly recommends that you do not modify this register unless directed by Arm.

This register is accessible as follows:

This register can be read with the MRS instruction using the following syntax:

```
MRS <Xt>, <systemreg>
```

This register can be written with the MSR instruction using the following syntax:

```
MSR <systemreg>, <Xt>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
S3_6_C15_8_4	11	110	1111	1000	010

Accessibility

This register is accessible in software as follows:

<systemreg>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
S3_6_C15_8_4	x	x	0	-	-	n/a	RW
S3_6_C15_8_4	x	0	1	-	-	-	RW
S3_6_C15_8_4	x	1	1	-	n/a	-	RW

'n/a' Not accessible. The core cannot be executing at this Exception level, so this access is not possible.

Traps and enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization* in the [Arm® Architecture Reference Manual for A-profile architecture](#).

3.2.55 CPUPPMCR_EL3, CPU Power Performance Management Configuration Register, EL3

The CPUPPMCR_EL3 provides **IMPLEMENTATION DEFINED** configuration and control options for the core.

Bit field descriptions

CPUPPMCR_EL3 is a 64-bit register, and is part of the **IMPLEMENTATION DEFINED** registers functional group.

Figure 3-50: CPUPPMCR_EL3 bit assignments

Reserved, [63:0]

Reserved for Arm® internal use.

Configurations

CPUPPMCR_EL3 is only accessible in Secure state.

Usage constraints

Accessing the CPUPPMCR_EL3

Writing to this register might cause **UNPREDICTABLE** behaviors. Therefore, Arm strongly recommends that you do not modify this register unless directed by Arm.

This register is accessible as follows:

This register can be read with the MRS instruction using the following syntax:

```
MRS <Xt>, <systemreg>
```

This register can be written with the MSR instruction using the following syntax:

```
MSR <systemreg>, <Xt>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
S3_6_C15_C2_0	11	110	1111	0010	000

Accessibility

This register is accessible in software as follows:

<systemreg>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
S3_6_C15_C2_0	x	x	0	-	-	n/a	RW
S3_6_C15_C2_0	x	0	1	-	-	-	RW
S3_6_C15_C2_0	x	1	1	-	n/a	-	RW

'n/a' Not accessible. The core cannot be executing at this Exception level, so this access is not possible.

Traps and enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization* in the [Arm® Architecture Reference Manual for A-profile architecture](#).

3.2.56 CPUPSELR_EL3, CPU Private Selection Register, EL3

The CPUPSELR_EL3 provides **IMPLEMENTATION DEFINED** configuration and control options for the core.

Bit field descriptions

CPUPSELR_EL3 is a 64-bit register, and is part of the **IMPLEMENTATION DEFINED** registers functional group.

Figure 3-51: CPUPSELR_EL3 bit assignments

Reserved, [63:0]

Reserved for Arm® internal use.

Configurations

CPUPSELR_EL3 is only accessible in Secure state.

Usage constraints**Accessing the CPUPSELR_EL3**

The CPUPSELR_EL3 can be written only when the system is idle. Arm recommends that you write to this register after a powerup reset, before the MMU is enabled.

Writing to this register might cause **UNPREDICTABLE** behaviors. Therefore, Arm strongly recommends that you do not modify this register unless directed by Arm.

This register is accessible as follows:

This register can be read with the MRS instruction using the following syntax:

```
MRS <Xt>, <systemreg>
```

This register can be written with the MSR instruction using the following syntax:

```
MSR <systemreg>, <Xt>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
S3_6_C15_8_0	11	110	1111	1000	000

Accessibility

This register is accessible in software as follows:

<systemreg>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
S3_6_C15_8_0	x	x	0	-	-	n/a	RW
S3_6_C15_8_0	x	0	1	-	-	-	RW
S3_6_C15_8_0	x	1	1	-	n/a	-	RW

'n/a' Not accessible. The core cannot be executing at this Exception level, so this access is not possible.

Traps and enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization* in the [Arm® Architecture Reference Manual for A-profile architecture](#).

3.2.57 CPUPWRCTLR_EL1, Power Control Register, EL1

The CPUPWRCTLR_EL1 provides information about power control support for the core.

Bit field descriptions

CPUPWRCTLR_EL1 is a 64-bit register, and is part of the **IMPLEMENTATION DEFINED** registers functional group.

Figure 3-52: CPUPWRCTLR_EL1 bit assignments

Reserved, [63:32]

Reserved

RES0, [31:10]

RES0 Reserved

WFE_RET_CTRL, [9:7]

CPU WFE retention control:

000	Disable the retention circuit. This is the default value, see Table 3-86: CPUPWRCTLR Retention Control Field on page 188 for more retention control options.
-----	--

WFI_RET_CTRL, [6:4]

CPU WFI retention control:

000	Disable the retention circuit. This is the default value, see Table 3-86: CPUPWRCTLR Retention Control Field on page 188 for more retention control options.
-----	--

RES0, [3:1]

RES0 Reserved

CORE_PWRDN_EN, [0]

Indicates to the power controller using PACTIVE if the core wants to power down when it enters *Wait For Interrupt* (WFI) state.

- 0** No power down requested. This is the reset value.
1 A power down is requested.

Table 3-86: CPUPWRCTLR Retention Control Field

Encoding	Number of counter ticks ⁷	Minimum retention entry delay (System counter at 50MHz-10MHz)
000	Disable the retention circuit	Default Condition
001	2	40ns-200ns
010	8	160ns-800ns
011	32	640ns – 3,200ns
100	64	1,280ns-6,400ns
101	128	2,560ns-12,800ns
110	256	5,120ns-25,600ns
111	512	10,240ns-51,200ns

Configurations

There are no configuration notes.

Usage constraints**Accessing the CPUPWRCTLR_EL1**

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This register can be written using MSR with the following syntax:

```
MSR <systemreg>, <Xt>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
S3_0_C15_C2_7	11	000	1111	0010	111

Accessibility

This register is accessible in software as follows:

⁷ The number of system counter ticks required before the core signals retention readiness on PACTIVE to the power controller. The core does not accept a retention entry request until this time.

<systemreg>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
S3_0_C15_C2_7	x	x	0	-	RW	n/a	RW
S3_0_C15_C2_7	x	0	1	-	RW	RW	RW
S3_0_C15_C2_7	x	1	1	-	n/a	RW	RW

'n/a' Not accessible. The PE cannot be executing at this Exception level, so this access is not possible.

Traps and enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization* in the [Arm® Architecture Reference Manual for A-profile architecture](#) for exceptions taken to AArch64 state.

Write-Access to this register from EL1 or EL2 depends on the value of bit[7] of ACTLR_EL2 and ACTLR_EL3.

3.2.58 CSSELR_EL1, Cache Size Selection Register, EL1

CSSELR_EL1 selects the current Cache Size ID Register (CCSIDR_EL1), by specifying:

- The required cache level
- The cache type, either instruction or data cache

For details of the CCSIDR_EL1, see [3.2.33 CCSIDR_EL1, Cache Size ID Register, EL1](#) on page 145.

Bit field descriptions

CSSELR_EL1 is a 64-bit register, and is part of the Identification registers functional group.

Figure 3-53: CSSELR_EL1 bit assignments

Reserved, [63:32]

Reserved.

RES0, [31:4]

RES0	Reserved
-------------	----------

Level, [3:1]

Cache level of required cache:

000	L1
001	L2
010	L3, if present

The combination of Level=001 and InD=1 is reserved.

The combinations of Level and InD for 0100 to 1111 are reserved.

InD, [0]

Instruction not Data bit:

0	Data or unified cache
1	Instruction cache

The combination of Level=001 and InD=1 is reserved.

The combinations of Level and InD for 0100 to 1111 are reserved.

Configurations

If a cache level is missing but CSSELR_EL1 selects this level, then a CCSIDR_EL1 read returns an **UNKNOWN** value.

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Architecture Reference Manual for A-profile architecture](#).

3.2.59 CTR_EL0, Cache Type Register, EL0

The CTR_EL0 provides information about the architecture of the caches.

Bit field descriptions

CTR_EL0 is a 32-bit register, and is part of the Identification registers functional group.

This register is read-only.

Figure 3-54: CTR_EL0 bit assignments

IDC, [28]

Data cache clean requirements for instruction to data coherence:

- | | |
|---|---|
| 0 | Data cache clean to the point of unification is required for instruction to data coherence, unless CLIDR_EL1.LoC == 0b000 or (CLIDR_EL1.LoUIS == 0b000 && CLIDR_EL1.LoUU == 0b000). |
| 1 | Data cache clean to the point of unification is not required for instruction to data coherence. |

IDC reflects the inverse value of the BROADCASTCACHEMAINTPOU pin.

CWG, [27:24]

Cache write-back granule. Log₂ of the number of words of the maximum size of memory that can be overwritten as a result of the eviction of a cache entry that has had a memory location in it modified:

- | | |
|------|--|
| 0100 | Cache write-back granule size is 16 words. |
|------|--|

ERG, [23:20]

Exclusives Reservation Granule. Log₂ of the number of words of the maximum size of the reservation granule that has been implemented for the Load-Exclusive and Store-Exclusive instructions:

- | | |
|------|---|
| 0100 | Exclusive reservation granule size is 16 words. |
|------|---|

DminLine, [19:16]

\log_2 of the number of words in the smallest cache line of all the data and unified caches that the core controls:

0100 Smallest data cache line size is 16 words.

L1Ip, [15:14]

Instruction cache policy. Indicates the indexing and tagging policy for the L1 Instruction cache:

11 *Physically Indexed Physically Tagged (PIPT).*

RES0, [13:4]

RES0 Reserved

IminLine, [3:0]

\log_2 of the number of words in the smallest cache line of all the instruction caches that the core controls.

0100 Smallest instruction cache line size is 16 words.

Configurations

There are no configuration notes.

Bit fields and details that are not provided in this description are architecturally defined. See the [Arm® Architecture Reference Manual for A-profile architecture](#).

3.2.60 DCZID_EL0, Data Cache Zero ID Register, EL0

The DCZID_EL0 indicates the block size written with byte values of zero by the `dc zva` (Data Cache Zero by Address) system instruction.

Bit field descriptions

DCZID_EL0 is a 64-bit register, and is part of the Identification registers functional group.

This register is read-only.

Figure 3-55: DCZID_EL0 bit assignments**RES0, [63:5]**

RES0 Reserved

BlockSize, [3:0]

Log₂ of the block size in words:

0100 The block size is 16 words.

Configurations

There are no configuration notes.

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Architecture Reference Manual for A-profile architecture](#).

3.2.61 DISR_EL1, Deferred Interrupt Status Register, EL1

The DISR_EL1 records the SError interrupts consumed by an `ESB` instruction.

Bit field descriptions

DISR_EL1 is a 64-bit register, and is part of the registers *Reliability, Availability, Serviceability* (RAS) functional group.

Figure 3-56: DISR_EL1 bit assignments, DISR_EL1.IDS is 0

RES0, [63:32]

RES0	Reserved
-------------	----------

A, [31]

Set to 1 when ESB defers an asynchronous SError interrupt. If the implementation does not include any synchronizable sources of SError interrupt, this bit is **RES0**.

RES0, [30:25]

RES0	Reserved
-------------	----------

IDS, [24]

Indicates the type of format the deferred SError interrupt uses. The value of this bit is:

0	Deferred error uses architecturally-defined format.
----------	---

RES0, [23:13]

RES0	Reserved
-------------	----------

AET, [12:10]

Asynchronous Error Type. Describes the state of the core after taking an asynchronous Data Abort exception. The possible values are:

000	Uncontainable error (UC)
001	Unrecoverable error (UEU)

The recovery software must also examine any implemented fault records to determine the location and extent of the error.

EA, [9]

RES0	Reserved
-------------	----------

RES0, [8:6]

RES0	Reserved
-------------	----------

DFSC, [5:0]

Data Fault Status Code. The possible values of this field are:

010001	Asynchronous SError interrupt
---------------	-------------------------------

Note

In AArch32 the 010001 code previously meant an Asynchronous External abort on memory access. With the RAS extension, it extends to include any asynchronous SError interrupt. The Parity Error codes are not used in the RAS extension.

Configurations

There are no configuration notes.

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Architecture Reference Manual for A-profile architecture](#).

3.2.62 ERRIDR_EL1, Error ID Register, EL1

The ERRIDR_EL1 defines the number of error record registers.

Bit field descriptions

ERRIDR_EL1 is a 64-bit register, and is part of the registers *Reliability, Availability, Serviceability* (RAS) functional group.

This register is read-only.

Figure 3-57: ERRIDR_EL1 bit assignments

 res0

RES0, [63:16]

RES0

There are no configuration notes.

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Architecture Reference Manual for A-profile architecture](#).

3.2.63 ERRSELR_EL1, Error Record Select Register, EL1

The ERRSELR_EL1 selects which error record should be accessed through the Error Record system registers. This register is not reset on a Warm reset.

Bit field descriptions

ERRSELR_EL1 is a 64-bit register, and is part of the *Reliability, Availability, Serviceability* (RAS) registers functional group.

Figure 3-58: ERRSELR_EL1 bit assignments

RES0, [63:1]

RES0 Reserved

SEL, [0]

Selects which error record should be accessed.

- | | |
|----------|--|
| 0 | Select error record 0 containing errors from L1 and L2 RAMs located on the Cortex®-A78AE core. |
| 1 | Select error record 1 containing errors from L3 RAMs located on the DSU-AE. |

Configurations

There are no configuration notes.

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Architecture Reference Manual for A-profile architecture](#).

3.2.64 ERXADDR_EL1, Selected Error Record Address Register, EL1

Register ERXADDR_EL1 accesses the ERR<n>ADDR address register for the error record selected by ERRSELR_EL1.SEL.

If ERRSELR_EL1.SEL==0, then ERXADDR_EL1 accesses the ERROADDR register of the core error record. See [3.3.2 ERROADDR, Error Record Address Register](#) on page 286.

3.2.65 ERXCTLR_EL1, Selected Error Record Control Register, EL1

Register ERXCTLR_EL1 accesses the ERR<n>CTLR control register for the error record selected by ERRSELR_EL1.SEL.

If ERRSELR_EL1.SEL==0, then ERXCTLR_EL1 accesses the ERROCTLR register of the core error record. See [3.3.3 ERROCTLR, Error Record Control Register](#) on page 287.

If ERRSELR_EL1.SEL==1, then ERXCTLR_EL1 accesses the ERR1CTLR register of the DSU-AE error record. See the *Arm® DynamIQ™ Shared Unit AE Technical Reference Manual*.

3.2.66 ERXFR_EL1, Selected Error Record Feature Register, EL1

Register ERXFR_EL1 accesses the ERR<n>FR feature register for the error record selected by ERRSELR_EL1.SEL.

If ERRSELR_EL1.SEL==0, then ERXFR_EL1 accesses the ERROFR register of the core error record. See [3.3.4 ERROFR, Error Record Feature Register](#) on page 289.

If ERRSELR_EL1.SEL==1, then ERXFR_EL1 accesses the ERR1FR register of the DSU-AE error record. See the *Arm® DynamIQ™ Shared Unit AE Technical Reference Manual*.

3.2.67 ERXMISCO_EL1, Selected Error Record Miscellaneous Register 0, EL1

Register ERXMISCO_EL1 accesses the ERR<n>MISCO register for the error record selected by ERRSELR_EL1.SEL.

If ERRSELR_EL1.SEL==0, then ERXMISCO_EL1 accesses the ERROMISCO register of the core error record. See [3.3.5 ERROMISCO, Error Record Miscellaneous Register 0](#) on page 291.

If ERRSELR_EL1.SEL==1, then ERXMISCO_EL1 accesses the ERR1MISCO register of the DSU-AE error record. See the *Arm® DynamIQ™ Shared Unit AE Technical Reference Manual*.

3.2.68 ERXMISC1_EL1, Selected Error Record Miscellaneous Register 1, EL1

Register ERXMISC1_EL1 accesses the ERR<n>MISC1 miscellaneous register 1 for the error record selected by ERRSELR_EL1.SEL.

If ERRSELR_EL1.SEL==0, then ERXMISC1_EL1 accesses the ERROMISC1 register of the core error record. See [3.3.6 ERROMISC1, Error Record Miscellaneous Register 1](#) on page 297.

If ERRSELR_EL1.SEL==1, then ERXMISC1_EL1 accesses the ERR1MISC1 register of the DSU-AE error record. See the *Arm® DynamIQ™ Shared Unit AE Technical Reference Manual*.

3.2.69 ERXPFGCDN_EL1, Selected Error Pseudo Fault Generation Count Down Register, EL1

Register ERXPFGCDN_EL1 accesses the ERR<n>PFGCDNR register for the error record selected by ERRSELR_EL1.SEL.

If ERRSELR_EL1.SEL==0, then ERXPFGCDN_EL1 accesses the ERR0PFGCDN register of the core error record. See [3.3.7 ERR0PFGCDN, Error Pseudo Fault Generation Count Down Register](#) on page 297.

If ERRSELR_EL1.SEL==1, then ERXPFGCDN_EL1 accesses the ERR1PFGCDNR register of the DSU-AE error record. See the *Arm® DynamIQ™ Shared Unit AE Technical Reference Manual*.

Configurations

There are no configuration notes.

Accessing the ERXPFGCDN_EL1

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This register can be written using MSR with the following syntax:

```
MSR <Xt>, <systemreg>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
S3_0_C15_C2_2	11	000	1111	0010	010

Accessibility

This register is accessible in software as follows:

<syntax>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
S3_0_C15_C2_2	x	x	0	-	RW	n/a	RW
S3_0_C15_C2_2	x	0	1	-	RW	RW	RW
S3_0_C15_C2_2	x	1	1	-	n/a	RW	RW

'n/a' Not accessible. Executing the PE at this Exception level is not permitted.

Traps and enables

For a description of the prioritization of any generated exceptions, see *Exception priority order* in the *Arm® Architecture Reference Manual for A-profile architecture* for exceptions taken to AArch32 state, and see *Synchronous exception prioritization* for exceptions taken to AArch64

state. Subject to these prioritization rules, the following traps and enables are applicable when accessing this register.

ERXPFPGCDN_EL1 is accessible at EL3 and can be accessible at EL1 and EL2 depending on the value of bit[5] in ACTLR_EL2 and ACTLR_EL3. See [3.2.6 ACTLR_EL2, Auxiliary Control Register, EL2](#) on page 111 and [3.2.7 ACTLR_EL3, Auxiliary Control Register, EL3](#) on page 113.

ERXPFPGCDN_EL1 is **UNDEFINED** at EL0.

3.2.70 ERXPFPGCTL_EL1, Selected Error Pseudo Fault Generation Control Register, EL1

Register ERXPFPGCTL_EL1 accesses the ERR<n>PFGCTLR register for the error record selected by ERRSELR_EL1.SEL.

If ERRSELR_EL1.SEL==0, then ERXPFPGCTL_EL1 accesses the ERROPFGCTLR register of the core error record. See [3.3.8 ERROPFGCTL, Error Pseudo Fault Generation Control Register](#) on page 298.

If ERRSELR_EL1.SEL==1, then ERXPFPGCTL_EL1 accesses the ERR1PFGCTLR register of the DSU-AE error record. See the *Arm® DynamIQ™ Shared Unit AE Technical Reference Manual*.

Configurations

There are no configuration notes.

Accessing the ERXPFPGCTL_EL1

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This register can be written using MSR with the following syntax:

```
MSR <Xt>, <systemreg>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
S3_0_C15_C2_1	11	000	1111	0010	001

Accessibility

This register is accessible in software as follows:

<syntax>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
S3_0_C15_C2_1	x	x	0	-	RW	n/a	RW
S3_0_C15_C2_1	x	0	1	-	RW	RW	RW

<syntax>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
S3_0_C15_C2_1	x	1	1	-	n/a	RW	RW

Traps and enables

For a description of the prioritization of any generated exceptions, see *Exception priority order* in the [Arm® Architecture Reference Manual for A-profile architecture](#) for exceptions taken to AArch32 state, and see *Synchronous exception prioritization* for exceptions taken to AArch64 state. Subject to these prioritization rules, the following traps and enables are applicable when accessing this register.

ERXPFPGCTL_EL1 is accessible at EL3 and can be accessible at EL1 and EL2 depending on the value of bit[5] in ACTLR_EL2 and ACTLR_EL3. See [3.2.6 ACTLR_EL2, Auxiliary Control Register, EL2](#) on page 111 and [3.2.7 ACTLR_EL3, Auxiliary Control Register, EL3](#) on page 113.

ERXPFPGCTL_EL1 is **UNDEFINED** at EL0.

If ERXPFPGCTL_EL1 is accessible at EL1 and HCR_EL2.TERR == 1, then direct reads and writes of ERXPFPGCTL_EL1 at Non-secure EL1 generate a Trap exception to EL2.

If ERXPFPGCTL_EL1 is accessible at EL1 or EL2 and SCR_EL3.TERR == 1, then direct reads and writes of ERXPFPGCTL_EL1 at EL1 or EL2 generate a Trap exception to EL3.

3.2.71 ERXPFGF_EL1, Selected Pseudo Fault Generation Feature Register, EL1

Register ERXPFGF_EL1 accesses the ERR<n>PFGF register for the error record selected by ERRSELR_EL1.SEL.

If ERRSELR_EL1.SEL==0, then ERXPFGF_EL1 accesses the ERR0PFGF register of the core error record. See [3.3.9 ERR0PFGF, Error Pseudo Fault Generation Feature Register](#) on page 302.

If ERRSELR_EL1.SEL==1, then ERXPFGF_EL1 accesses the ERR1PFGF register of the DSU-AE error record. See the *Arm® DynamIQ™ Shared Unit AE Technical Reference Manual*.

Configurations

This core has no configuration notes.

Accessing the ERXPFGF_EL1

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
S3_0_C15_C2_0	11	000	1111	0010	000

Accessibility

This register is accessible in software as follows:

<syntax>	Control			Accessibility			
	E2H	TGE	NS	ELO	EL1	EL2	EL3
S3_0_C15_C2_0	x	x	0	-	RO	n/a	RO
S3_0_C15_C2_0	x	0	1	-	RO	RO	RO
S3_0_C15_C2_0	x	1	1	-	n/a	RO	RO

'n/a' Not accessible. The PE cannot be executing at this Exception level, so this access is not possible.

Traps and enables

For a description of the prioritization of any generated exceptions, see *Exception priority order* in the [Arm® Architecture Reference Manual for A-profile architecture](#) for exceptions taken to AArch32 state, and see *Synchronous exception prioritization* for exceptions taken to AArch64 state. Subject to these prioritization rules, the following traps and enables are applicable when accessing this register.

ERXPFG_EL1 is accessible at EL3 and can be accessible at EL1 and EL2 depending on the value of bit[5] in ACTLR_EL2 and ACTLR_EL3. See [3.2.6 ACTLR_EL2, Auxiliary Control Register, EL2](#) on page 111 and [3.2.7 ACTLR_EL3, Auxiliary Control Register, EL3](#) on page 113.

ERXPFG_EL1 is **UNDEFINED** at ELO.

If ERXPFG_EL1 is accessible at EL1 and HCR_EL2.TERR == 1, then direct reads and writes of ERXPFG_EL1 at Non-secure EL1 generate a Trap exception to EL2.

If ERXPFG_EL1 is accessible at EL1 or EL2 and SCR_EL3.TERR == 1, then direct reads and writes of ERXPFG_EL1 at EL1 or EL2 generate a Trap exception to EL3.

3.2.72 ERXSTATUS_EL1, Selected Error Record Primary Status Register, EL1

Register ERXSTATUS_EL1 accesses the ERR<n>STATUS primary status register for the error record selected by ERRSELR_EL1.SEL.

If ERRSELR_EL1.SEL==0, then ERXSTATUS_EL1 accesses the ERROSTATUS register of the core error record. See [3.3.10 ERROSTATUS, Error Record Primary Status Register](#) on page 305.

If ERRSELR_EL1.SEL==1, then ERXSTATUS_EL1 accesses the ERR1STATUS register of the DSU-AE error record. See the *Arm® DynamIQ™ Shared Unit AE Technical Reference Manual*.

3.2.73 ESR_EL1, Exception Syndrome Register, EL1

The ESR_EL1 holds syndrome information for an exception taken to EL1.

Bit field descriptions

ESR_EL1 is a 64-bit register, and is part of the Exception and fault handling registers functional group.

Figure 3-59: ESR_EL1 bit assignments

Reserved, [63:32]

Reserved.

EC, [31:26]

Exception Class. Indicates the reason for the exception that this register holds information about.

IL, [25]

Instruction Length for synchronous exceptions. The possible values are:

0	16-bit
1	32-bit

This field is 1 for the SError interrupt, instruction aborts, misaligned PC, Stack pointer misalignment, data aborts for which the ISV bit is 0, exceptions caused by an illegal instruction set state, and exceptions using the 0x00 Exception Class.

ISS, [24:0]

Syndrome information

When reporting a virtual SEI, bits[24:0] take the value of VSESRL_EL2[24:0].

When reporting a physical SEI, the following occurs:

- IDS==0 (architectural syndrome)
- AET always reports an uncontrollable error (UC) with value 0b000 or an unrecoverable error (UEU) with value 0b001.

- EA is **RESO**.

When reporting a synchronous data abort, EA is **RES0**.

See [3.2.129 VESR_EL2, Virtual SError Exception Syndrome Register](#) on page 282.

Configurations

This register has no configuration options.

3.2.74 ESR_EL2, Exception Syndrome Register, EL2

The ESR_EL2 holds syndrome information for an exception taken to EL2.

Bit field descriptions

ESR_EL2 is a 64-bit register, and is part of:

- The Virtualization registers functional group
- The Exception and fault handling registers functional group

Figure 3-60: ESR_EL2 bit assignments

Reserved, [63:32]

Reserved.

EC, [31:26]

Exception Class. Indicates the reason for the exception that this register holds information about. See the [Arm® Architecture Reference Manual for A-profile architecture](#) for more information.

IL, [25]

Instruction Length for synchronous exceptions. The possible values are:

0	16-bit
1	32-bit

See the [Arm® Architecture Reference Manual for A-profile architecture](#) for more information.

ISS, [24:0]

Syndrome information. See the [Arm® Architecture Reference Manual for A-profile architecture](#) for more information.

When reporting a virtual SEI, bits[24:0] take the value of VSESRL_EL2[24:0].

When reporting a physical SEI, the following occurs:

- IDS=0 (architectural syndrome)
- AET always reports an uncontainable error (UC) with value 0b000 or an unrecoverable error (UEU) with value 0b001.
- EA is **RES0**.

When reporting a synchronous Data Abort, EA is **RES0**.

See [3.2.129 VESR_EL2, Virtual SError Exception Syndrome Register](#) on page 282.

Configurations

RW fields in this register reset to architecturally **UNKNOWN** values.

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Architecture Reference Manual for A-profile architecture](#).

3.2.75 ESR_EL3, Exception Syndrome Register, EL3

The ESR_EL3 holds syndrome information for an exception taken to EL3.

Bit field descriptions

ESR_EL3 is a 64-bit register, and is part of the Exception and fault handling registers functional group.

Figure 3-61: ESR_EL3 bit assignments

Reserved, [63:32]

Reserved.

EC, [31:26]

Exception Class. Indicates the reason for the exception that this register holds information about.

IL, [25]

Instruction Length for synchronous exceptions. The possible values are:

0	16-bit
1	32-bit

This field is 1 for the SError interrupt, instruction aborts, misaligned PC, Stack pointer misalignment, data aborts for which the ISV bit is 0, exceptions caused by an illegal instruction set state, and exceptions using the 0x0 Exception Class.

ISS, [24:0]

Syndrome information

When reporting a virtual SEI, bits[24:0] take the value of VSESRL_EL2[24:0].

When reporting a physical SEI, the following occurs:

- IDS==0 (architectural syndrome)
- AET always reports an uncontrollable error (UC) with value 0b000 or an unrecoverable error (UEU) with value 0b001.
- EA is **RES0**.

When reporting a synchronous data abort, EA is **RES0**.

See [3.2.129 VSESRL_EL2, Virtual SError Exception Syndrome Register](#) on page 282.

Configurations

RW fields in this register reset to architecturally **UNKNOWN** values.

3.2.76 HACR_EL2, Hyp Auxiliary Configuration Register, EL2

The HACR_EL2 register controls trapping to EL2 of **IMPLEMENTATION DEFINED** aspects of Non-secure EL1 or EL0 operation. This register is not used in the Cortex®-A78AE core.

Bit field descriptions

HACR_EL2 is a 64-bit register, and is part of Virtualization registers functional group.

Figure 3-62: HACR_EL2 bit assignments**Reserved, [63:32]**

Reserved.

RES0, [31:0]

RES0

Reserved

Configurations

There are no configuration notes.

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Architecture Reference Manual for A-profile architecture](#).

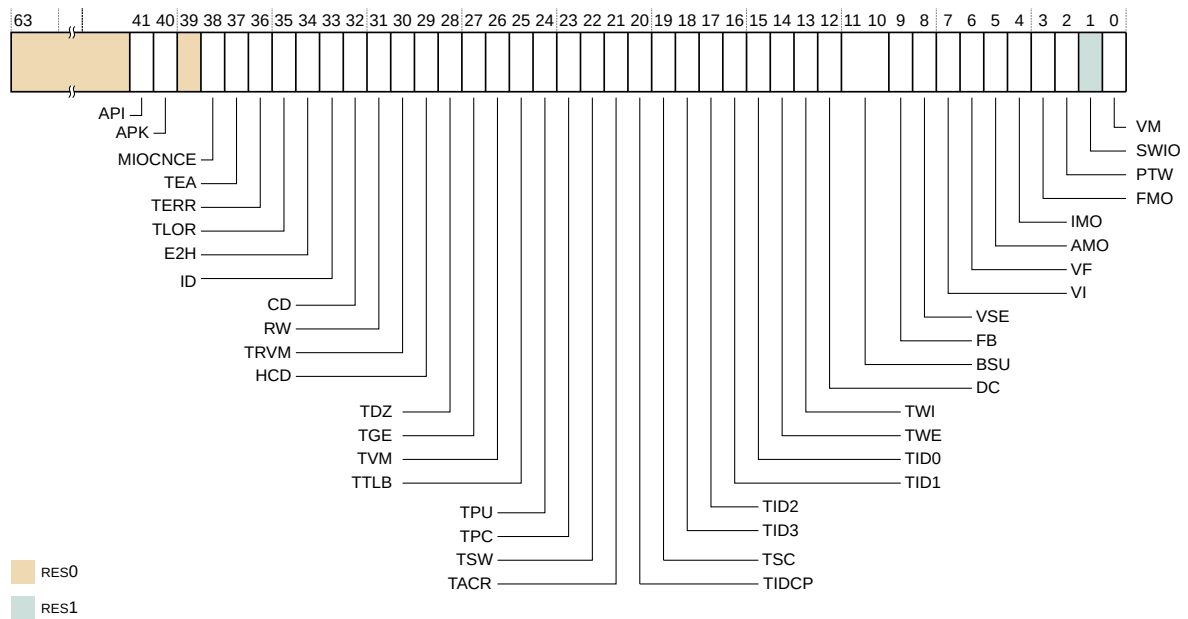

3.2.77 HCR_EL2, Hypervisor Configuration Register, EL2

The HCR_EL2 provides configuration control for virtualization, including whether various Non-secure operations are trapped to EL2.

Bit field descriptions

HCR_EL2 is a 64-bit register, and is part of the Virtualization registers functional group.

Figure 3-63: HCR_EL2 bit assignments

RES0, [63:42]

RES0 Reserved

API, [41]

Controls the use of instructions related to Pointer Authentication. The possible values are:

- | | |
|---|--|
| 0 | Use of these instructions in Non-secure EL0 when HCR_EL2.TGE==0 HCR_EL2.E2H==0, or in Non-secure EL1 when the instructions are enabled for the Non-secure EL1 translation regime is trapped to EL2. The ESR_EL2.EC code in the event of such traps is 0x9, and the ESR_EL2.ISS field is RES0. |
| 1 | This control does not cause any instructions to be trapped. |

This field resets to an architecturally **UNKNOWN** value.

APK, [40]

The possible values are:

- | | |
|---|---|
| 0 | Access to the authentication key registers from non-secure EL1 are trapped to EL2. The ESR_EL2.EC code in the event of such traps is 0x18, and the ESR_EL2.ISS field takes the standard meanings. |
| 1 | Access to these registers are not trapped to EL2 by this mechanism. If EL2 is not implemented, the system behaves as if HCR_EL2.APK = 1. |

This field resets to an architecturally **UNKNOWN** value.

RES0, [39]

RES0	Reserved
-------------	----------

MIOCNCE, [38]

Mismatched Inner/Outer Cacheable Non-Coherency Enable, for the Non-secure EL1 and EL0 translation regime.

RW, [31]

RES1	Reserved
-------------	----------

HCD, [29]

RES0	Reserved
-------------	----------

TGE, [27]

Traps general exceptions. If this bit is set, and SCR_EL3.NS is set, then:

- All exceptions that would be routed to EL1 are routed to EL2.
- The SCTLR_EL1.M bit is treated as 0 regardless of its actual state, other than for reading the bit.
- The HCR_EL2.FMO, IMO, and AMO bits are treated as 1 regardless of their actual state, other than for reading the bits.
- All virtual interrupts are disabled.
- Any **IMPLEMENTATION DEFINED** mechanisms for signaling virtual interrupts are disabled.
- An exception return to EL1 is treated as an illegal exception return.

HCR_EL2.TGE must not be cached in a TLB.

When the value of SCR_EL3.NS is 0 the core behaves as if this field is 0 for all purposes other than a direct read or write access of HCR_EL2.

TID3, [18]

Traps ID group 3 registers. The possible values are:

0	ID group 3 register accesses are not trapped.
1	Reads to ID group 3 registers executed from Non-secure EL1 are trapped to EL2.

See the [Arm® Architecture Reference Manual for A-profile architecture](#) for the registers covered by this setting.

Configurations

If EL2 is not implemented, this register is **RES0** from EL3.

RW fields in this register reset to architecturally **UNKNOWN** values.

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Architecture Reference Manual for A-profile architecture](#).

3.2.78 ID_AA64AFR0_EL1, AArch64 Auxiliary Feature Register 0

The core does not use this register, ID_AA64AFR0_EL1 is **RES0**.

3.2.79 ID_AA64AFR1_EL1, AArch64 Auxiliary Feature Register 1

The core does not use this register, ID_AA64AFR0_EL1 is **RES0**.

3.2.80 ID_AA64DFR0_EL1, AArch64 Debug Feature Register 0, EL1

Provides top-level information about the debug system in AArch64.

Bit field descriptions

ID_AA64DFR0_EL1 is a 64-bit register, and is part of the Identification registers functional group.

This register is read-only.

AT, [35:32]

Identifies support for unaligned single-copy atomicity and atomic functions. The value is:

0x1 Unaligned single-copy atomicity and atomic functions with a 16-byte address range aligned to 16-bytes are supported.

The Cortex®-A78AE core includes some Arm®v8.4-A features and has atomicity requirements.

RES0, [31:20]

RES0 Reserved

VARange, [19:16]

Indicates support for a larger virtual address. The value is:

0x0 VMSAv8-64 supports 48-bit virtual addresses.

IESB, [15:12]

Indicates whether an implicit Error Synchronization Barrier has been inserted. The value is:

0x1 SCTLR_ELx.IESB implicit `ErrorSynchronizationBarrier` control implemented.

LSM, [11:8]

Indicates whether LDM and STM ordering control bits are supported. The value is:

0x0 LSMAOE and nTLSMD bit not supported

UAO, [7:4]

Indicates the presence of the *User Access Override* (UAO). The value is:

0x1 UAO supported

CnP, [3:0]

Common not Private. Indicates whether a TLB entry is pointed at a translation table base register that is a member of a common set. The value is:

0x1 CnP bit supported

Configurations

There are no configuration notes.

Bit fields and details that are not provided in this description are architecturally defined. See the [Arm® Architecture Reference Manual for A-profile architecture](#).

3.2.87 ID_AA64PFR0_EL1, AArch64 Processor Feature Register 0, EL1

The ID_AA64PFR0_EL1 provides additional information about implemented core features in AArch64.

The optional Advanced SIMD and floating-point support is not included in the base product of the core. Arm requires licensees to have contractual rights to obtain the Advanced SIMD and floating-point support.

Bit field descriptions

ID_AA64PFR0_EL1 is a 64-bit register, and is part of the Identification registers functional group.

This register is read-only.

3.2.92 ID_ISAR1_EL1, AArch32 Instruction Set Attribute Register 1, EL1

The ID_ISAR1_EL1 provides information about the instruction sets implemented by the core in AArch32.

Bit field descriptions

ID_ISAR1_EL1 is a 64-bit register, and is part of the Identification registers functional group.

This register is read-only.

Figure 3-75: ID_ISAR1_EL1 bit assignments

63	32	31	28	27	24	23	20	19	16	15	12	11	8	7	4	3	0	
Reserved				Jazelle		Interwork		Immediate		IfThen		Extend		Except_AR		Except		Endian

Reserved, [63:32]

Reserved.

Jazelle, [31:28]

Indicates the implemented Jazelle state instructions:

0x1 Adds the `BXJ` instruction, and the J bit in the PSR

Interwork, [27:24]

Indicates the implemented Interworking instructions:

0x3

- The `BX` instruction, and the T bit in the PSR
- The `BLX` instruction. The PC loads have `BX`-like behavior.
- Data-processing instructions in the A32 instruction set with the PC as the destination and the S bit clear, have `BX`-like behavior.

Immediate, [23:20]

Indicates the implemented data-processing instructions with long immediates:

0x1

- The `MOVT` instruction
- The `MOV` instruction encodings with zero-extended 16-bit immediates

- The T32 `ADD` and `SUB` instruction encodings with zero-extended 12-bit immediates, and other `ADD`, `ADR`, and `SUB` encodings cross-referenced by the pseudocode for those encodings

IfThen, [19:16]

Indicates the implemented If-Then instructions in the T32 instruction set:

0x1 The `IT` instructions, and the `IT` bits in the PSRs

Extend, [15:12]

Indicates the implemented Extend instructions:

0x2

- The `SXTB`, `SXTH`, `UXTB`, and `UXTH` instructions
- The `SXTB16`, `SXTAB`, `SXTAB16`, `SXTAH`, `UXTB16`, `UXTAB`, `UXTAB16`, and `UXTAH` instructions

Except_AR, [11:8]

Indicates the implemented A profile exception-handling instructions:

0x1 The `SRS` and `RFE` instructions, and the A profile forms of the `CPS` instruction

Except, [7:4]

Indicates the implemented exception-handling instructions in the A32 instruction set:

0x1 The `LDM` (exception return), `LDM` (user registers), and `STM` (user registers) instruction versions

Endian, [3:0]

Indicates the implemented Endian instructions:

0x1 The `SETEND` instruction, and the `E` bit in the PSRs

Configurations

In an AArch64-only implementation, this register is **UNKNOWN**.

Must be interpreted with `ID_ISAR0_EL1`, `ID_ISAR2_EL1`, `ID_ISAR3_EL1`, `ID_ISAR4_EL1`, `ID_ISAR5_EL1`, and `ID_ISAR6_EL1`. See:

3.2.93 ID_ISAR2_EL1, AArch32 Instruction Set Attribute Register 2, EL1

The ID_ISAR2_EL1 provides information about the instruction sets implemented by the core in AArch32.

Bit field descriptions

ID_ISAR2_EL1 is a 64-bit register, and is part of the Identification registers functional group.

This register is read-only.

Figure 3-76: ID_ISAR2_EL1 bit assignments

Reserved, [63:32]

Reserved.

Reversal, [31:28]

Indicates the implemented Reversal instructions:

0x2

The REV, REV16, REVSH, and RBIT instructions

PSR_AR, [27:24]

Indicates the implemented A and R profile instructions to manipulate the PSR:

0x1

The MRS and MSR instructions, and the exception return forms of data-processing instructions

The exception return forms of the data-processing instructions are:

- In the A32 instruction set, data-processing instructions with the PC as the destination and the S bit set
- In the T32 instruction set, the SUBSPC, LR, #N instruction

MultU, [23:20]

Indicates the implemented advanced unsigned Multiply instructions:

0x2 The `UMULL`, `UMLAL`, and `UMAAL` instructions

MultS, [19:16]

Indicates the implemented advanced signed Multiply instructions.

0x3

- The `SMULL` and `SMLAL` instructions
- The `SMLABB`, `SMLABT`, `SMLALBB`, `SMLALBT`, `SMLALTB`, `SMLALTT`, `SMLATB`, `SMLATT`, `SMLAWB`, `SMLAWT`, `SMULBB`, `SMULBT`, `SMULTB`, `SMULTT`, `SMULWB`, `SMULWT` instructions, and the Q bit in the PSRs
- The `SMLAD`, `SMLADX`, `SMLALD`, `SMLALDX`, `SMLSD`, `SMLSIX`, `SMLSID`, `SMLSIXD`, `SMMLA`, `SMMLAR`, `SMMLS`, `SMMLSR`, `SMMUL`, `SMMULR`, `SMUAD`, `SMUADX`, `SMUSD`, and `SMUSDIX` instructions

Mult, [15:12]

Indicates the implemented additional Multiply instructions:

0x2 The `MUL`, `MLA` and `MLS` instructions

MultiAccessInt, [11:8]

Indicates the support for interruptible multi-access instructions:

0x0 No support. This means the `LDM` and `STM` instructions are not interruptible.

MemHint, [7:4]

Indicates the implemented memory hint instructions:

0x4 The `PLD`, `PLI`, and `PLDW` instructions

LoadStore, [3:0]

Indicates the implemented additional load/store instructions:

0x2 The `LDRD` and `STRD` instructions

The Load Acquire (`LDAB`, `LDAH`, `LDA`, `LDAEXB`, `LDAEXH`, `LDAEX`, and `LDAEXD`) and Store Release (`STLB`, `STLH`, `STL`, `STLEXB`, `STLEXH`, `STLEX`, and `STLEXD`) instructions.

Configurations

In an AArch64-only implementation, this register is **UNKNOWN**.

Must be interpreted with `ID_ISAR0_EL1`, `ID_ISAR1_EL1`, `ID_ISAR3_EL1`, `ID_ISAR4_EL1`, `ID_ISAR5_EL1`, and `ID_ISAR6_EL1`. See:

- [3.2.91 ID_ISAR0_EL1, AArch32 Instruction Set Attribute Register 0, EL1](#) on page 225
- [3.2.92 ID_ISAR1_EL1, AArch32 Instruction Set Attribute Register 1, EL1](#) on page 226
- [3.2.94 ID_ISAR3_EL1, AArch32 Instruction Set Attribute Register 3, EL1](#) on page 231

- [3.2.95 ID_ISAR4_EL1, AArch32 Instruction Set Attribute Register 4, EL1](#) on page 233.
- [3.2.96 ID_ISAR5_EL1, AArch32 Instruction Set Attribute Register 5, EL1](#) on page 235
- [3.2.97 ID_ISAR6_EL1, AArch32 Instruction Set Attribute Register 6, EL1](#) on page 237

Bit fields and details that are not provided in this description are architecturally defined. See the [Arm® Architecture Reference Manual for A-profile architecture](#).

3.2.94 ID_ISAR3_EL1, AArch32 Instruction Set Attribute Register 3, EL1

The ID_ISAR3_EL1 provides information about the instruction sets implemented by the core in AArch32.

Bit field descriptions

ID_ISAR3_EL1 is a 64-bit register, and is part of the Identification registers functional group.

This register is read-only.

Figure 3-77: ID_ISAR3_EL1 bit assignments

63	32	31	28	27	24	23	20	19	16	15	12	11	8	7	4	3	0	
Reserved				T32EE		TrueNOP		T32Copy		TabBranch		SynchPrim		SVC		SIMD		Saturate

Reserved, [63:32]

Reserved.

T32EE, [31:28]

Indicates the implemented T32EE instructions:

0x0 None implemented

TrueNOP, [27:24]

Indicates support for True NOP instructions:

0x1 True NOP instructions in both the A32 and T32 instruction sets, and additional NOP-compatible hints

T32Copy, [23:20]

Indicates the support for T32 non flag-setting mov instructions:

0x1 Support for T32 instruction set encoding T1 of the `mov` (register) instruction, copying from a low register to a low register

TabBranch, [19:16]

Indicates the implemented Table Branch instructions in the T32 instruction set.

0x1 The `TBB` and `TBH` instructions

SynchPrim, [15:12]

Indicates the implemented Synchronization Primitive instructions:

0x2

- The `LDREX` and `STREX` instructions
- The `CLREX`, `LDREXB`, `STREXB`, and `STREXH` instructions
- The `LDREXD` and `STREXD` instructions

SVC, [11:8]

Indicates the implemented SVC instructions:

0x1 The `svc` instruction

SIMD, [7:4]

Indicates the implemented *Single Instruction Multiple Data* (SIMD) instructions.

0x3

- The `SSAT` and `USAT` instructions, and the Q bit in the PSRs
- The `PKHBT`, `PKHTB`, `QADD16`, `QADD8`, `QASX`, `QSUB16`, `QSUB8`, `QSAX`, `SADD16`, `SADD8`, `SASX`, `SEL`, `SHADD16`, `SHADD8`, `SHASX`, `SHSUB16`, `SHSUB8`, `SHSAX`, `SSAT16`, `SSUB16`, `SSUB8`, `SSAX`, `SXTAB16`, `SXTB16`, `UADD16`, `UADD8`, `UASX`, `UHADD16`, `UHADD8`, `UHASX`, `UHSUB16`, `UHSUB8`, `UHSAX`, `UQADD16`, `UQADD8`, `UQASX`, `UQSUB16`, `UQSUB8`, `UQSAX`, `USAD8`, `USADA8`, `USAT16`, `USUB16`, `USUB8`, `USAX`, `UXTAB16`, `UXTB16` instructions, and the GE[3:0] bits in the PSRs

The SIMD field relates only to implemented instructions that perform SIMD operations on the general-purpose registers. In an implementation that supports Advanced SIMD and floating-point instructions, `MVFR0`, `MVFR1`, and `MVFR2` give information about the implemented Advanced SIMD instructions.

Saturate, [3:0]

Indicates the implemented Saturate instructions:

0x1 The `QADD`, `QDADD`, `QDSUB`, `QSUB` Q bit in the PSRs

Configurations

In an AArch64-only implementation, this register is **UNKNOWN**.

Must be interpreted with `ID_ISAR0_EL1`, `ID_ISAR1_EL1`, `ID_ISAR2_EL1`, `ID_ISAR4_EL1`, `ID_ISAR5_EL1`, and `ID_ISAR6_EL1`. See:

- [3.2.91 ID_ISAR0_EL1, AArch32 Instruction Set Attribute Register 0, EL1](#) on page 225
- [3.2.92 ID_ISAR1_EL1, AArch32 Instruction Set Attribute Register 1, EL1](#) on page 226
- [3.2.93 ID_ISAR2_EL1, AArch32 Instruction Set Attribute Register 2, EL1](#) on page 229
- [3.2.95 ID_ISAR4_EL1, AArch32 Instruction Set Attribute Register 4, EL1](#) on page 233
- [3.2.96 ID_ISAR5_EL1, AArch32 Instruction Set Attribute Register 5, EL1](#) on page 235
- [3.2.97 ID_ISAR6_EL1, AArch32 Instruction Set Attribute Register 6, EL1](#) on page 237

Bit fields and details that are not provided in this description are architecturally defined. See the [Arm® Architecture Reference Manual for A-profile architecture](#).

3.2.95 ID_ISAR4_EL1, AArch32 Instruction Set Attribute Register 4, EL1

The ID_ISAR4_EL1 provides information about the instruction sets implemented by the core in AArch32.

Bit field descriptions

ID_ISAR4_EL1 is a 64-bit register, and is part of the Identification registers functional group.

This register is read-only.

Figure 3-78: ID_ISAR4_EL1 bit assignments

Reserved, [63:32]

Reserved.

SWP_frac, [31:28]

Indicates support for the memory system locking the bus for SWP or SWPB instructions:

0x0 SWP and SWPB instructions not implemented

PSR_M, [27:24]

Indicates the implemented M profile instructions to modify the PSRs:

0x0 None implemented

SynchPrim_frac, [23:20]

This field is used with the ID_ISAR3.SynchPrim field to indicate the implemented Synchronization Primitive instructions:

0x0

- The LDREX and STREX instructions
- The CLREX, LDREXB, LDREXH, STREXB, and STREXH instructions
- The LDREXD and STREXD instructions

Barrier, [19:16]

Indicates the supported Barrier instructions in the A32 and T32 instruction sets:

0x1

The DMB, DSB, and ISB barrier instructions

SMC, [15:12]

Indicates the implemented SMC instructions:

0x0

None implemented

WriteBack, [11:8]

Indicates the support for Write-Back addressing modes:

0x1

Core supports all the Write-Back addressing modes as defined in Arm®v8-A

WithShifts, [7:4]

Indicates the support for instructions with shifts:

0x4

- Support for shifts of loads and stores over the range LSL 0-3
- Support for other constant shift options, both on load/store and other instructions
- Support for register-controlled shift options

Unpriv, [3:0]

Indicates the implemented unprivileged instructions:

0x2

- The LDRBT, LDRT, STRBT, and STRT instructions
- The LDRHT, LDRSBT, LDRSHT, and STRHT instructions

Configurations

In an AArch64-only implementation, this register is **UNKNOWN**.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, ID_ISAR5_EL1, and ID_ISAR6_EL1. See:

- [3.2.91 ID_ISAR0_EL1, AArch32 Instruction Set Attribute Register 0, EL1](#) on page 225

- 3.2.92 ID_ISAR1_EL1, AArch32 Instruction Set Attribute Register 1, EL1 on page 226
- 3.2.93 ID_ISAR2_EL1, AArch32 Instruction Set Attribute Register 2, EL1 on page 229
- 3.2.94 ID_ISAR3_EL1, AArch32 Instruction Set Attribute Register 3, EL1 on page 231
- 3.2.96 ID_ISAR5_EL1, AArch32 Instruction Set Attribute Register 5, EL1 on page 235
- 3.2.97 ID_ISAR6_EL1, AArch32 Instruction Set Attribute Register 6, EL1 on page 237

Bit fields and details that are not provided in this description are architecturally defined. See the [Arm® Architecture Reference Manual for A-profile architecture](#).

3.2.96 ID_ISAR5_EL1, AArch32 Instruction Set Attribute Register 5, EL1

The ID_ISAR5_EL1 provides information about the instruction sets that the core implements.

Bit field descriptions

ID_ISAR5_EL1 is a 64-bit register, and is part of the Identification registers functional group.

This register is read-only.

Figure 3-79: ID_ISAR5_EL1 bit assignments

Reserved, [63:32]

RES0, [31:28]

RES0 Reserved

RDM, [27:24]

VQRDMLAH and VQRDMLSH instructions in AArch32. The value is:

0x1 VQRDMLAH and VQRDMLSH instructions are implemented.

RES0, [23:20]

RES0	Reserved
-------------	----------

CRC32, [19:16]

Indicates whether CRC32 instructions are implemented in AArch32 state. The value is:

0x1	CRC32B, CRC32H, CRC32W, CRC32CB, CRC32CH, and CRC32CW instructions are implemented.
------------	---

SHA2, [15:12]

Indicates whether SHA2 instructions are implemented in AArch32 state. The possible values are:

0x0	No SHA2 instructions implemented. This is the value when the Cryptographic Extensions are not implemented or are disabled.
0x1	SHA256H, SHA256H2, SHA256SU0, and SHA256SU1 instructions are implemented. This is the value when the Cryptographic Extensions are implemented and enabled.

SHA1, [11:8]

Indicates whether SHA1 instructions are implemented in AArch32 state. The possible values are:

0x0	No SHA1 instructions implemented. This is the value when the Cryptographic Extensions are not implemented or are disabled.
0x1	SHA1C, SHA1P, SHA1M, SHA1H, SHA1SU0, and SHA1SU1 instructions are implemented. This is the value when the Cryptographic Extensions are implemented and enabled.

AES, [7:4]

Indicates whether AES instructions are implemented in AArch32 state. The possible values are:

0x0	No AES instructions implemented. This is the value when the Cryptographic Extensions are not implemented or are disabled.
0x2	<ul style="list-style-type: none"> • AESE, AESD, AESMC, and AESIMC implemented • PMULL and PMULL2 instructions operating on 64-bit data

This is the value when the Cryptographic Extensions are implemented and enabled.

SEVL, [3:0]

Indicates whether the SEVL instruction is implemented:

0x1	SEVL implemented to send event local
------------	--------------------------------------

Configurations

ID_ISAR5 must be interpreted with ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, ID_ISAR4_EL1, and ID_ISAR6_EL1. See:

Reserved, [63:32]

Reserved.

InnerShr, [31:28]

Indicates the innermost shareability domain implemented:

0x1	Implemented with hardware coherency support
------------	---

FCSE, [27:24]Indicates support for *Fast Context Switch Extension* (FCSE):

0x0	Not supported
------------	---------------

AuxReg, [23:20]

Indicates support for Auxiliary registers:

0x2	Support for Auxiliary Fault Status Registers (AIFSR and ADFSR) and Auxiliary Control Register
------------	---

TCM, [19:16]

Indicates support for TCMs and associated DMAs:

0x0	Not supported
------------	---------------

ShareLvl, [15:12]

Indicates the number of shareability levels implemented:

0x1	Two levels of shareability implemented
------------	--

OuterShr, [11:8]

Indicates the outermost shareability domain implemented:

0x1	Implemented with hardware coherency support
------------	---

PMSA, [7:4]Indicates support for a *Protected Memory System Architecture* (PMSA):

0x0	Not supported
------------	---------------

VMSA, [3:0]Indicates support for a *Virtual Memory System Architecture* (VMSA).

0x5	Support for: <ul style="list-style-type: none"> • VMSAv7, with support for remapping and the Access flag • The PXN bit in the Short-descriptor translation table format descriptors
------------	---

- The Long-descriptor translation table format

Configurations

Must be interpreted with ID_MMFR1_EL1, ID_MMFR2_EL1, ID_MMFR3_EL1, and ID_MMFR4_EL1. See:

- [3.2.99 ID_MMFR1_EL1, AArch32 Memory Model Feature Register 1, EL1](#) on page 240

HWAaccFlg, [31:28]

Hardware access flag. Indicates support for a hardware access flag, as part of the VMSAv7 implementation:

0x0 Not supported

WFIStall, [27:24]

Wait For Interrupt Stall. Indicates the support for *Wait For Interrupt* (WFI) stalling:

0x1 Support for WFI stalling

MemBarr, [23:20]

Memory Barrier. Indicates the supported CP15 memory barrier operations.

0x2

Supported CP15 memory barrier operations are:

- *Data Synchronization Barrier* (DSB)
- *Instruction Synchronization Barrier* (ISB)
- *Data Memory Barrier* (DMB)

UniTLB, [19:16]

Unified TLB. Indicates the supported TLB maintenance operations, for a unified TLB implementation.

0x6

Supported unified TLB maintenance operations are:

- Invalidate all entries in the TLB
- Invalidate TLB entry by MVA
- Invalidate TLB entries by ASID match
- Invalidate instruction TLB and data TLB entries by MVA All ASID. This is a shared unified TLB operation.
- Invalidate Hyp mode unified TLB entry by MVA
- Invalidate entire Non-secure EL1 and EL0 unified TLB
- Invalidate entire Hyp mode unified TLB
- TLBIMVALIS, TLBIMVAALIS, TLBIMVALHIS, TLBIMVAL, TLBIMVAAL, and TLBIMVALH
- TLBIIPAS2IS, TLBIIPAS2LIS, TLBIIPAS2, and TLBIIPAS2L

HvdTLB, [15:12]

Harvard TLB. Indicates the supported TLB maintenance operations, for a Harvard TLB implementation:

0x0

Not supported

LL1HvdRng, [11:8]

L1 Harvard cache Range. Indicates the supported L1 cache maintenance range operations, for a Harvard cache implementation:

0x0

Not supported

L1HvdBG, [7:4]

L1 Harvard cache Background fetch. Indicates the supported L1 cache background prefetch operations, for a Harvard cache implementation:

0x0

Not supported

L1HvdFG, [3:0]

L1 Harvard cache Foreground fetch. Indicates the supported L1 cache foreground prefetch operations, for a Harvard cache implementation:

0x0 Not supported

Configurations

Must be interpreted with ID_MMFR0_EL1, ID_MMFR1_EL1, ID_MMFR3_EL1, and ID_MMFR4_EL1. See:

- [3.2.98 ID_MMFR0_EL1, AArch32 Memory Model Feature Register 0, EL1](#) on page 238

Non-Confidential

0x0 Supersections supported

CMemSz, [27:24]

Cached memory size. Indicates the size of physical memory supported by the core caches:

0x2 1TByte or more, corresponding to a 40-bit or larger physical address range

CohWalk, [23:20]

Coherent walk. Indicates whether translation table updates require a clean to the point of unification:

0x1 Updates to the translation tables do not require a clean to the point of unification to ensure visibility by subsequent translation table walks.

PAN, [19:16]

Privileged Access Never

0x2

PAN supported and new `ATS1CPRP` and `ATS1CPWP` instructions supported

MaintBcst, [15:12]

Maintenance broadcast. Indicates whether cache, TLB, and branch predictor operations are broadcast:

0x2 Cache, TLB, and branch predictor operations affect structures according to shareability and defined behavior of instructions.

BPMaint, [11:8]

Branch predictor maintenance. Indicates the supported branch predictor maintenance operations:

0x2 Supported branch predictor maintenance operations are:

- Invalidate all branch predictors
- Invalidate branch predictors by MVA

CMaintSW, [7:4]

Cache maintenance by set/way. Indicates the supported cache maintenance operations by set/way:

0x1 Supported hierarchical cache maintenance operations by set/way are:

- Invalidate data cache by set/way
- Clean data cache by set/way
- Clean and invalidate data cache by set/way

CMaintVA, [3:0]

Cache maintenance by *Virtual Address* (VA). Indicates the supported cache maintenance operations by VA:

0x1 Supported hierarchical cache maintenance operations by VA are:

- Invalidate data cache by VA
- Clean data cache by VA
- Clean and invalidate data cache by VA
- Invalidate instruction cache by VA
- Invalidate all instruction cache entries

Configurations

Must be interpreted with ID_MMFR0_EL1, ID_MMFR1_EL1, ID_MMFR2_EL1, and ID_MMFR4_EL1. See:

- [3.2.98 ID_MMFR0_EL1, AArch32 Memory Model Feature Register 0, EL1](#) on page 238
- [3.2.99 ID_MMFR1_EL1, AArch32 Memory Model Feature Register 1, EL1](#) on page 240
- [3.2.100 ID_MMFR2_EL1, AArch32 Memory Model Feature Register 2, EL1](#) on page 242
- [3.2.102 ID_MMFR4_EL1, AArch32 Memory Model Feature Register 4, EL1](#) on page 246

Bit fields and details that are not provided in this description are architecturally defined. See the [Arm® Architecture Reference Manual for A-profile architecture](#).

3.2.102 ID_MMFR4_EL1, AArch32 Memory Model Feature Register 4, EL1

The ID_MMFR4_EL1 provides information about the memory model and memory management support in AArch32.

Bit field descriptions

ID_MMFR4_EL1 is a 64-bit register, and is part of the Identification registers functional group.

This register is read-only.

Figure 3-85: ID_MMFR4_EL1 bit assignments

63	32	31	24	23	20	19	16	15	12	11	8	7	4	3	0
Reserved		RAZ		LSM		HPDS		CNP		XNX		AC2		SpecSEI	

RAZ, [31:24]

Read-As-Zero

LSM, [23:20]

Load/Store Multiple. Indicates whether adjacent loads or stores can be combined. The value is:

0x0 LSMAOE and nTLSMD bit not supported

HPDS, [19:16]

Presence of Hierarchical Disables. Enables an operating system or hypervisor to hand over up to 4 bits of the last level page table descriptor (bits[62:59] of the page table entry) for use by hardware for **IMPLEMENTATION DEFINED** usage. The value is:

0x2 Hierarchical Permission Disables and Hardware allocation of bits[62:59] supported

CNP, [15:12]

Common Not Private. Indicates support for selective sharing of TLB entries across multiple PEs. The value is:

0x1 CnP bit supported

XNX, [11:8]

Execute-never. Indicates whether the stage 2 translation tables allows the stage 2 control of whether memory is executable at EL1 independent of whether memory is executable at EL0. The value is:

0x1 EL0/EL1 execute control distinction at stage 2 bit supported

AC2, [7:4]

Indicates the extension of the ACTLR and HACTLR registers using ACTLR2 and HACTLR2. The value is:

0x1 ACTLR2 and HACTLR2 implemented

SpecSEI, [3:0]

Describes whether the core can generate SError interrupt exceptions from speculative reads of memory, including speculative instruction fetches. The value is:

0x0 The core never generates an SError interrupt due to an External abort on a speculative read.

Configurations

There is one copy of this register that is used in both Secure and Non-secure states.

Must be interpreted with ID_MMFR0_EL1, ID_MMFR1_EL1, ID_MMFR2_EL1, and ID_MMFR3_EL1. See:

- [3.2.98 ID_MMFR0_EL1, AArch32 Memory Model Feature Register 0, EL1](#) on page 238
- [3.2.99 ID_MMFR1_EL1, AArch32 Memory Model Feature Register 1, EL1](#) on page 240
- [3.2.100 ID_MMFR2_EL1, AArch32 Memory Model Feature Register 2, EL1](#) on page 242
- [3.2.101 ID_MMFR3_EL1, AArch32 Memory Model Feature Register 3, EL1](#) on page 244

Bit fields and details that are not provided in this description are architecturally defined. See the [Arm® Architecture Reference Manual for A-profile architecture](#).

3.2.103 ID_PFR0_EL1, AArch32 Processor Feature Register 0, EL1

The ID_PFR0_EL1 provides top-level information about the instruction sets supported by the core in AArch32.

Bit field descriptions

ID_PFR0_EL1 is a 64-bit register, and is part of the Identification registers functional group.

This register is read-only.

Figure 3-86: ID_PFR0_EL1 bit assignments

Reserved, [63:32]

CSV2, [19:16]

0x0	This device does not disclose whether branch targets trained in one context can affect speculative execution in a different context.
0x1	Branch targets trained in one context cannot affect speculative execution in a different hardware described context. This is the reset value.

State3, [15:12]

Indicates support for *Thumb Execution Environment* (T32EE) instruction set. This value is:

0x0	Core does not support the T32EE instruction set.
------------	--

State2, [11:8]

Indicates support for Jazelle. This value is:

0x1	Core supports trivial implementation of Jazelle.
------------	--

State1, [7:4]

Indicates support for T32 instruction set. This value is:

0x3	Core supports T32 encoding after the introduction of Thumb-2 technology, and for all 16-bit and 32-bit T32 basic instructions.
------------	--

State0, [3:0]

Indicates support for A32 instruction set. This value is:

0x1	A32 instruction set implemented
------------	---------------------------------

Configurations

There are no configuration notes.

Bit fields and details that are not provided in this description are architecturally defined. See the [Arm® Architecture Reference Manual for A-profile architecture](#).

3.2.104 ID_PFR1_EL1, AArch32 Processor Feature Register 1, EL1

The ID_PFR1_EL1 provides information about the programmers model and architecture extensions supported by the core.

Bit field descriptions

ID_PFR1_EL1 is a 64-bit register, and is part of the Identification registers functional group.

This register is read-only.

Configurations

There are no configuration notes.

Bit fields and details that are not provided in this description are architecturally defined. See the [Arm® Architecture Reference Manual for A-profile architecture](#).

3.2.110 MIDR_EL1, Main ID Register, EL1

The MIDR_EL1 provides identification information for the core, including an implementer code for the device and a device ID number.

Bit field descriptions

MIDR_EL1 is a 64-bit register, and is part of the Identification registers functional group.

This register is read-only.

Figure 3-93: MIDR_EL1 bit assignments

Implementer, [31:24]

Indicates the implementer code. This value is:

0x41 ASCII character 'A' - implementer is Arm® Limited.

Variant, [23:20]

Indicates the variant number of the core. This is the major revision number x in the rx part of the rxy description of the product revision status. This value is:

0x0 r0p3

Architecture, [19:16]

Indicates the architecture code. This value is:

0xF Defined by CUID scheme

PartNum, [15:4]

Indicates the primary part number. This value is:

0xD42 Cortex®-A78AE core

Revision, [3:0]

Indicates the minor revision number of the core. This is the minor revision number y in the py part of the rxy description of the product revision status. This value is:

0x3 r0p3

Configurations

The MIDR_EL1 is architecturally mapped to external MIDR_EL1 register.

Bit fields and details that are not provided in this description are architecturally defined. See the [Arm® Architecture Reference Manual for A-profile architecture](#).

3.2.111 MPIDR_EL1, Multiprocessor Affinity Register, EL1

The MPIDR_EL1 provides an additional core identification mechanism for scheduling purposes in a cluster.

Bit field descriptions

MPIDR_EL1 is a 64-bit register, and is part of the Other system control registers functional group.

This register is read-only.

Figure 3-94: MPIDR_EL1 bit assignments

RES0, [63:40]

RES0 Reserved

Aff3, [39:32]

Affinity level 3. Highest level affinity field.

CLUSTERID

Indicates the value read in the CLUSTERIDAFF3 configuration signal.

RES1, [31]

RES1 Reserved

U, [30]

Indicates a single core system, as distinct from core 0 in a cluster. This value is:

0 Core is part of a multiprocessor system. This is the value for implementations with more than one core, and for implementations with an ACE or CHI master interface.

RES0, [29:25]

RES0 Reserved

MT, [24]

Indicates whether the lowest level of affinity consists of logical cores that are implemented using a multithreading type approach. This value is:

- 1 Performance of PEs at the lowest affinity level is very interdependent.

Affinity0 represents threads. Cortex®-A78AE is not multithreaded, but may be in a system with other cores that are multithreaded.

Aff2, [23:16]

Affinity level 2. Second highest level affinity field.

CLUSTERID

Indicates the value read in the CLUSTERIDAFF2 configuration signal.

Aff1, [15:11]

Part of Affinity level 1. Third highest level affinity field.

RAZ Read-As-Zero

Aff1, [10:8]

Part of Affinity level 1. Third highest level affinity field.

CPUID Identification number for each CPU in the cluster:

0x0	MP1: CPUID: 0
0x7	MP8: CPUID: 7

Aff0, [7:0]

Affinity level 0. The level identifies individual threads within a multithreaded core. The Cortex®-A78AE core is single-threaded, so this field has the value 0x00.

Configurations

MPIDR_EL1[31:0] is mapped to external register EDDEVAFF0.

MPIDR_EL1[63:32] is mapped to external register EDDEVAFF1.

Bit fields and details that are not provided in this description are architecturally defined. See the [Arm® Architecture Reference Manual for A-profile architecture](#).

3.2.112 PAR_EL1, Physical Address Register, EL1

The PAR_EL1 returns the output address from an address translation instruction that executed successfully, or fault information if the instruction did not execute successfully.

Bit field descriptions, PAR_EL1.F is 0

The following figure shows the PAR bit assignments when PAR.F is 0.

Figure 3-95: PAR bit assignments, PAR_EL1.F is 0

IMP DEF, [10]

IMPLEMENTATION DEFINED. Bit[10] is **RES0**.

F, [0]

Indicates whether the instruction performed a successful address translation.

0	Address translation completed successfully
1	Address translation aborted

Configurations

There are no configuration notes.

Bit fields and details that are not provided in this description are architecturally defined. See the [Arm® Architecture Reference Manual for A-profile architecture](#).

3.2.114 RMR_EL3, Reset Management Register

The RMR_EL3 controls the Execution state that the core boots into and allows request of a Warm reset.

Bit field descriptions

RMR_EL3 is a 32-bit register, and is part of the Reset management registers functional group.

Figure 3-97: RMR_EL3 bit assignments

RES0, [31:2]

RES0 Reserved

RR, [1]

Reset Request. The possible values are:

0	This is the reset value on both a Warm and a Cold reset.
1	Requests a Warm reset.

The bit is strictly a request.

RES1, [0]

RES1 Reserved

Configurations

There are no configuration notes.

Details that are not provided in this description are architecturally defined. See the [Arm® Architecture Reference Manual for A-profile architecture](#).

3.2.115 RVBAR_EL3, Reset Vector Base Address Register, EL3

RVBAR_EL3 contains the **IMPLEMENTATION DEFINED** address that execution starts from after reset.

Bit field descriptions

RVBAR_EL3 is a 64-bit register, and is part of the Reset management registers functional group.

This register is read-only.

Figure 3-98: RVBAR_EL3 bit assignments

RVBA, [63:0]

Reset Vector Base Address. The address that execution starts from after reset when executing in 64-bit state. Bits[1:0] of this register are 0b00, as this address must be aligned, and bits [63:40] are 0x000000 because the address must be within the physical address size supported by the core.

Configurations

There are no configuration notes.

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Architecture Reference Manual for A-profile architecture](#).

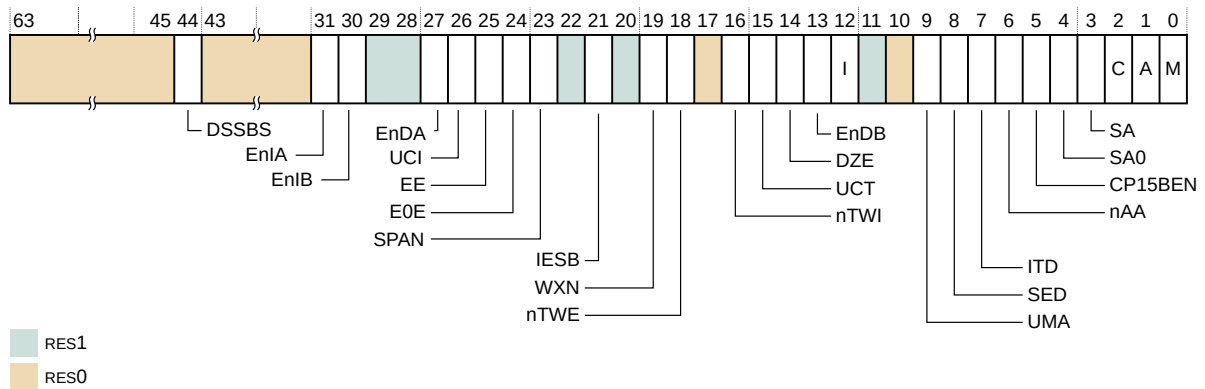

3.2.116 SCTL_EL1, System Control Register, EL1

The SCTL_EL1 provides top-level control of the system, including its memory system, at EL1 and EL0.

Bit field descriptions

SCTL_EL1 is a 64-bit register, and is part of the Other system control registers functional group.

This register resets to 0x0000000030D50838.

Figure 3-99: SCTLR_EL1 bit assignments**RES0, [63:45]**

RES0 Reserved

DSSBS, [44]

DSSBS is used to set the new PSTATE bit, SSBS (Speculative Store Bypassing Safe).

0x0 PSTATE.SSBS is set to 0 on an exception taken to this Exception level. This is the reset value.

0x1 PSTATE.SSBS is set to 1 on an exception taken to this Exception level.

RES0, [43:32]

RES0 Reserved

EnIA, [31]

Controls enabling of pointer authentication of instruction addresses in the EL1&0 translation regime. The possible values of this bit are:

0 Pointer authentication of instruction addresses is not enabled.

1 Pointer authentication of instruction addresses is enabled.

EnIB, [30]

Controls enabling of pointer authentication of instruction addresses in the EL1&0 translation regime. The possible values of this bit are:

0 Pointer authentication of instruction addresses is not enabled.

1 Pointer authentication of instruction addresses is enabled.

Controls enabling of pointer authentication of instruction addresses in the EL1&0 translation regime. The possible values of this bit are:

0	Pointer authentication of instruction addresses is not enabled.
1	Pointer authentication of instruction addresses is enabled.

EE, [25]

Exception endianness. The value of this bit controls the endianness for explicit data accesses at EL1. This value also indicates the endianness of the translation table data for translation table lookups. The possible values of this bit are:

0	Little-endian
1	Big-endian

IESB, [21]

Implicit error synchronization event enable. Possible values are:

0	Disabled
1	An implicit error synchronization event is added: <ul style="list-style-type: none"> • After each exception taken to EL1 • Before the operational pseudocode of each ERET instruction executed at EL1

EnDB, [13]

Controls enabling of pointer authentication of instruction addresses in the EL1&0 translation regime. The possible values of this bit are:

0	Pointer authentication of instruction addresses is not enabled.
1	Pointer authentication of instruction addresses is enabled.

ITD, [7]

This field is **RAZ/WI**.

nAA, [6]

When ARMv8.4-LSE is implemented, this bit controls generation of Alignment faults at EL1 and EL0 under certain conditions. The possible values are:

0b0	LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAPURW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, and STLURH generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes for accesses.
0b1	This control bit does not cause LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAPURW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, or STLURH

to generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes.

This field resets to an architecturally **UNKNOWN** value.

CP15BEN, [5]

CP15 barrier enable. The possible values are:

0	CP15 barrier operations disabled. Their encodings are UNDEFINED .
1	CP15 barrier operations are enabled.

M, [0]

MMU enable. The possible values are:

0	EL1 and EL0 stage 1 MMU disabled
1	EL1 and EL0 stage 1 MMU enabled

Configurations

There are no configuration notes.

Bit fields and details that are not provided in this description are architecturally defined. See the [Arm® Architecture Reference Manual for A-profile architecture](#).

3.2.117 SCTLR_EL2, System Control Register, EL2

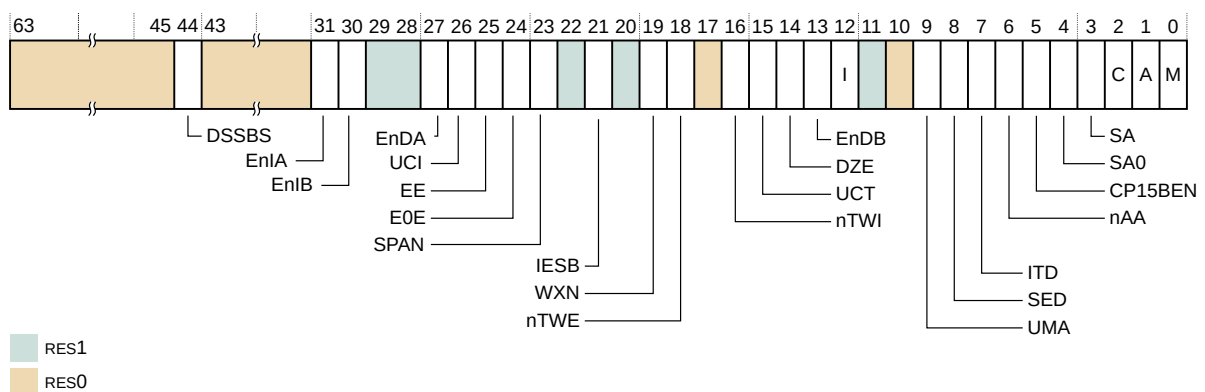

The SCTLR_EL2 provides top-level control of the system, including its memory system at EL2.

Bit field descriptions

SCTLR_EL2 is a 64-bit register, and is part of:

- The Virtualization registers functional group
- The Other system control registers functional group

Figure 3-100: SCTLR_EL1 bit assignments

This register resets to 0x30C50838.

RES0, [63:45]

RES0	Reserved
-------------	----------

DSSBS, [44]

DSSBS is used to set the new PSTATE bit, SSBS (Speculative Store Bypassing Safe).

SCTLR_EL2.DSSBS is held in bit[44] regardless of the value of HCR_EL2.E2H or HCR_EL2.TGE.

0x0	PSTATE.SSBS is set to 0 on an exception taken to this Exception level. This is the reset value.
0x1	PSTATE.SSBS is set to 1 on an exception taken to this Exception level.

UCI, [26]

Enables EL0 access to the DC CVAU, DC CIVAC, DC CVAC and IC IVAU instructions in the AArch64 Execution state. The possible values are:

0	ELO access disabled. This is the reset value.
1	ELO access enabled.

EE, [25]

Exception endianness. This bit controls the endianness for:

- Explicit data accesses at EL3
- Stage 1 translation table walks at EL3

The possible values are:

0x0	Little-endian
0x1	Big-endian

The reset value is determined by the CFGEND configuration signal.

EOE, [24]

Endianness of explicit data access at ELO. The possible values are:

0	Explicit data accesses at ELO are little-endian. This is reset value.
1	Explicit data accesses at ELO are big-endian.

IESB, [21]

When ARMv8.4-LSE is implemented, this bit controls generation of Alignment faults at EL1 and ELO under certain conditions. The possible values are:

0b0	Disabled
0b1	An implicit error synchronization event is added: <ul style="list-style-type: none"> • After each exception taken to EL2 • Before the operational pseudocode of each ERET instruction executed at EL2

nTWE, [18]

wFE non-trapping. The possible values are:

0	A wFE instruction executed at ELO, that, if this bit was set to 1, would permit entry to a low-power state, is trapped to EL1.
1	wFE instructions executed as normal. This is the reset value.

RES0, [17]

RES0	Reserved.
-------------	-----------

nTWI, [16]

wFI non-trapping. The possible values are:

0	A wFI instruction executed at ELO, that, if this bit was set to 1, would permit entry to a low-power state, is trapped to EL1.
----------	---

1 `WFI` instructions executed as normal. This is the reset value.

UCT, [15]

Enables ELO access to the CTR_ELO register in AArch64 Execution state. The possible values are:

0 Disables ELO access to the CTR_ELO register. This is the reset value.
1 Enables ELO access to the CTR_ELO register.

DZE, [14]

Enables access to the DC ZVA instruction at ELO. The possible values are:

0 Disables execution access to the DC ZVA instruction at ELO. The instruction is trapped to EL1. This is the reset value.
1 Enables execution access to the DC ZVA instruction at ELO.

EnDB, [13]

Controls enabling of pointer authentication of instruction addresses in the EL1&0 translation regime. The possible values of this bit are:

0 Pointer authentication of instruction addresses is not enabled.
1 Pointer authentication of instruction addresses is enabled.

SED, [8]

SETEND instruction disable. The possible values are:

0 The SETEND instruction is enabled. This is the reset value.
1 The SETEND instruction is **UNDEFINED**.

nAA, [6]

When ARMv8.4-LSE is implemented, this bit controls generation of Alignment faults at EL1 and ELO under certain conditions. The possible values are:

0b0 LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAPURW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, and STLURH generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes for accesses.
0b1 This control bit does not cause LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAPURW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, or STLURH to generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes.

This field resets to an architecturally **UNKNOWN** value.

CP15BEN, [5]

CP15 barrier enable. The possible values are:

- | | |
|---|--|
| 0 | CP15 barrier operations disabled. Their encodings are UNDEFINED . |
| 1 | CP15 barrier operations are enabled. |

SA0, [4]

Enable ELO stack alignment check. The possible values are:

- | | |
|---|--|
| 0 | Disable ELO stack alignment check. |
| 1 | Enable ELO stack alignment check. This is the reset value. |

Configurations

If EL2 is not implemented, this register is **RES0** from EL3.

Bit fields and details that are not provided in this description are architecturally defined. See the [Arm® Architecture Reference Manual for A-profile architecture](#).

3.2.118 SCTL_EL3, System Control Register, EL3

The SCTL_EL3 provides top-level control of the system, including its memory system at EL3.

Bit field descriptions

SCTL_EL3 is a 64-bit register, and is part of the Other system control registers functional group.

This register resets to 0x30C50838.

Figure 3-101: SCTL_EL3 bit assignments**RES0, [63:45]**

- | | |
|------|----------|
| RES0 | Reserved |
|------|----------|

DSSBS, [44]

DSSBS is used to set the new PSTATE bit, SSBS (Speculative Store Bypassing Safe).

- | | |
|------------|---|
| 0x0 | PSTATE.SSBS is set to 0 on an exception taken to this Exception level. This is the reset value. |
| 0x1 | PSTATE.SSBS is set to 1 on an exception taken to this Exception level. |

RES0, [43:32]

RES0	Reserved
-------------	----------

EnIA, [31]

Controls enabling of pointer authentication of instruction addresses in the EL1&0 translation regime. The possible values of this bit are:

0	Pointer authentication of instruction addresses is not enabled.
1	Pointer authentication of instruction addresses is enabled.

EnIB, [30]

Controls enabling of pointer authentication of instruction addresses in the EL1&0 translation regime. The possible values of this bit are:

0	Pointer authentication of instruction addresses is not enabled.
1	Pointer authentication of instruction addresses is enabled.

RES1, [29:28]

RES1	Reserved
-------------	----------

EnDA, [27]

Controls enabling of pointer authentication of instruction addresses in the EL1&0 translation regime. The possible values of this bit are:

0	Pointer authentication of instruction addresses is not enabled.
1	Pointer authentication of instruction addresses is enabled.

RES0, [26]

RES0	Reserved
-------------	----------

EE, [25]

Exception endianness. This bit controls the endianness for:

- Explicit data accesses at EL3
- Stage 1 translation table walks at EL3

The possible values are:

0x0	Little-endian
0x1	Big-endian

The reset value is determined by the CFGEND configuration signal.

EnDB, [13]

Controls enabling of pointer authentication of instruction addresses in the EL1&0 translation regime. The possible values of this bit are:

0	Pointer authentication of instruction addresses is not enabled.
1	Pointer authentication of instruction addresses is enabled.

I, [12]

Global instruction cache enable. The possible values are:

0x0	Instruction caches disabled. This is the reset value.
0x1	Instruction caches enabled.

nAA, [6]

This bit controls generation of Alignment faults at EL1 and EL0 under certain conditions. The possible values are:

0b0	LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAPURW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, and STLURH generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes for accesses.
0b1	This control bit does not cause LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAPURW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, or STLURH to generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes.

This field resets to an architecturally **UNKNOWN** value.

C, [2]

Global enable for data and unifies caches. The possible values are:

0x0	Disables data and unified caches. This is the reset value.
0x1	Enables data and unified caches.

M, [0]

Global enable for the EL3 MMU. The possible values are:

0x0	Disables EL3 MMU. This is the reset value.
0x1	Enables EL3 MMU.

Configurations

There are no configuration notes.

Bit fields and details that are not provided in this description are architecturally defined. See the [Arm® Architecture Reference Manual for A-profile architecture](#).

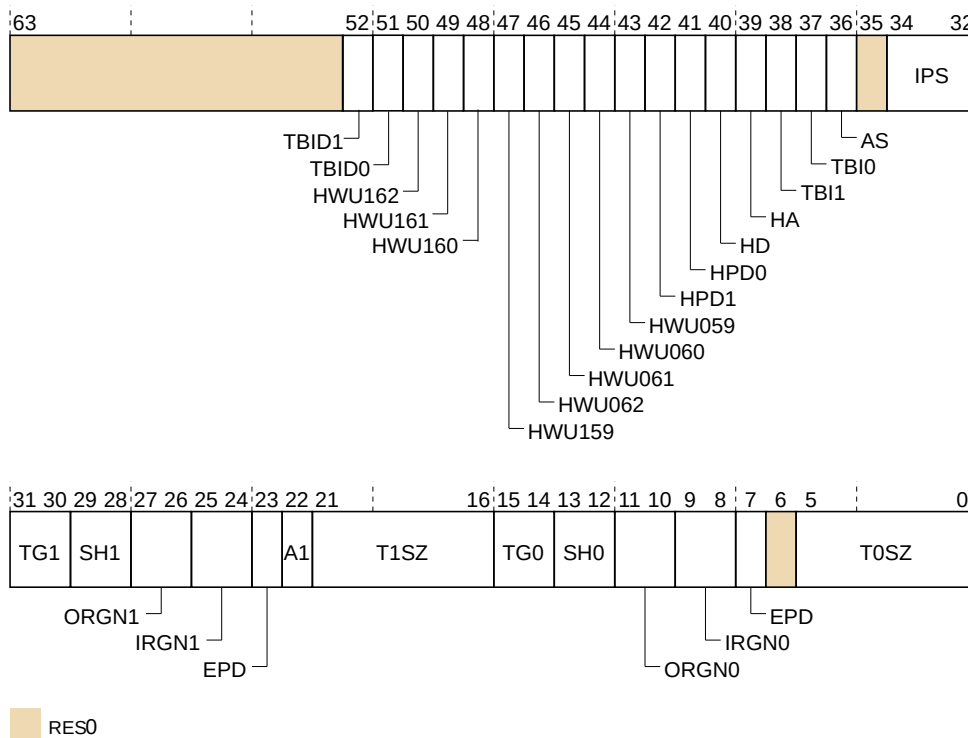

3.2.119 TCR_EL1, Translation Control Register, EL1

The TCR_EL1 determines which Translation Base registers define the base address register for a translation table walk required for stage 1 translation of a memory access from EL0 or EL1 and holds cacheability and shareability information.

Bit field descriptions

TCR_EL1 is a 64-bit register, and is part of the Virtual memory control registers functional group.

Figure 3-102: TCR_EL1 bit assignments

Bits[50:39], architecturally defined, are implemented in the core.

TBID0, [52]

The possible values are:

- | | |
|----------|---|
| 0 | TBID0 applies to Instruction and Data accesses. |
| 1 | TBID0 only applies to Data accesses. |

TBID1, [51]

The possible values are:

0	TBID1 applies to Instruction and Data accesses.
1	TBID1 only applies to Data accesses.

HD, [40]

Hardware management of dirty state in stage 1 translations from EL0 and EL1. The possible values are:

0	Stage 1 hardware management of dirty state is disabled.
1	Stage 1 hardware management of dirty state is enabled, only if the HA bit is also set to 1.

HA, [39]

Hardware Access flag update in stage 1 translations from EL0 and EL1. The possible values are:

0	Stage 1 Access flag update is disabled.
1	Stage 1 Access flag update is enabled.

Configurations

RW fields in this register reset to **UNKNOWN** values.

Bit fields and details that are not provided in this description are architecturally defined. See the [Arm® Architecture Reference Manual for A-profile architecture](#).

3.2.120 TCR_EL2, Translation Control Register, EL2

The TCR_EL2 controls translation table walks required for stage 1 translation of a memory access from EL2 and holds cacheability and shareability information.

Bit field descriptions

TCR_EL2 is a 64-bit register.

TCR_EL2 is part of:

- The Virtual memory control registers functional group
- The Hypervisor and virtualization registers functional group

Figure 3-103: TCR_EL2 bit assignments

Bits[28:21], architecturally defined, are implemented in the core.

TBID, [29]

Controls the use of the top byte of instruction addresses for address matching. The possible values are:

- | | |
|----------|---|
| 0 | TBI applies to Instruction and Data accesses. |
| 1 | TBI applies to Data accesses only. |

This field resets to an architecturally **UNKNOWN** value.

HD, [22]

Dirty bit update. The possible values are:

- | | |
|----------|-------------------------------|
| 0 | Dirty bit update is disabled. |
| 1 | Dirty bit update is enabled. |

HA, [21]

Stage 1 Access flag update. The possible values are:

- | | |
|----------|---|
| 0 | Stage 1 Access flag update is disabled. |
| 1 | Stage 1 Access flag update is enabled. |

Configurations

When the Virtualization Host Extension is activated, TCR_EL2 has the same bit assignments as TCR_EL1.

Bit fields and details that are not provided in this description are architecturally defined. See the [Arm® Architecture Reference Manual for A-profile architecture](#).

3.2.121 TCR_EL3, Translation Control Register, EL3

The TCR_EL3 controls translation table walks required for stage 1 translation of memory accesses from EL3 and holds cacheability and shareability information for the accesses.

Bit field descriptions

TCR_EL3 is a 64-bit register and is part of the Virtual memory control registers functional group.

Figure 3-104: TCR_EL3 bit assignments

Bits[28:21], architecturally defined, are implemented in the core.

Reserved, [63:32]

Reserved.

TBID, [29]

Controls the use of the top byte of instruction addresses for address matching. The possible values are:

- | | |
|----------|---|
| 0 | TBI applies to Instruction and Data accesses. |
| 1 | TBI applies to Data accesses only. |

This field resets to an architecturally **UNKNOWN** value.

HD, [22]

Dirty bit update. The possible values are:

- | | |
|----------|-------------------------------|
| 0 | Dirty bit update is disabled. |
| 1 | Dirty bit update is enabled. |

HA, [21]

Stage 1 Access flag update. The possible values are:

0	Stage 1 Access flag update is disabled.
1	Stage 1 Access flag update is enabled.

Configurations

There are no configuration notes.

Bit fields and details that are not provided in this description are architecturally defined. See the [Arm® Architecture Reference Manual for A-profile architecture](#).

3.2.122 TTBR0_EL1, Translation Table Base Register 0, EL1

The TTBR0_EL1 holds the base address of translation table 0, and information about the memory it occupies. This is one of the translation tables for the stage 1 translation of memory accesses from modes other than Hyp mode.

Bit field descriptions

TTBR0_EL1 is 64-bit register.

Figure 3-105: TTBR0_EL1 bit assignments

ASID, [63:48]

An ASID for the translation table base address. The TCR_EL1.A1 field selects either TTBR0_EL1.ASID or TTBR1_EL1.ASID.

BADDR[47:x], [47:1]

Translation table base address, bits[47:x]. Bits [x-1:1] are **RES0**.

x is based on the value of TCR_EL1.TOSZ, the stage of translation, and the memory translation granule size.

For instructions on how to calculate it, see the [Arm® Architecture Reference Manual for A-profile architecture](#).

The value of x determines the required alignment of the translation table, that must be aligned to 2^x bytes.

If bits [x-1:1] are not all zero, this is a misaligned translation table base address. Its effects are **CONSTRAINED UNPREDICTABLE**, where bits [x-1:1] are treated as if all the bits are zero. The value read back from those bits is the value written.

CnP, [0]

Common not Private. The possible values are:

0	CnP not supported
1	CnP supported

Configurations

There are no configuration notes.
Bit fields and details that are not provided in this description are architecturally defined. See the [Arm® Architecture Reference Manual for A-profile architecture](#).

3.2.123 TTBR0_EL2, Translation Table Base Register 0, EL2

The TTBR0_EL2 holds the base address of the translation table for the stage 1 translation of memory accesses from EL2.

Bit field descriptions

TTBR0_EL2 is a 64-bit register, and is part of the Virtual memory control registers functional group.

Figure 3-106: TTBR0_EL2 bit assignments

RES0, [63:48]

RES0	Reserved
------	----------

BADDR, [47:1]

Translation table base address, bits[47:x]. Bits [x-1:1] are **RES0**.

x is based on the value of TCR_EL2.TOSZ, the stage of translation, and the memory translation granule size.

For instructions on how to calculate it, see the *Arm® Architecture Reference Manual Arm®v8, for Arm®v8-A architecture profile*.

The value of x determines the required alignment of the translation table, that must be aligned to 2^x bytes.

If bits [x-1:1] are not all zero, this is a misaligned translation table base address. Its effects are **CONSTRAINED UNPREDICTABLE**, where bits [x-1:1] are treated as if all the bits are zero. The value read back from those bits is the value written.

CnP, [0]

Common not Private. The possible values are:

0	CnP not supported
1	CnP supported

Configurations

When the Virtualization Host Extension is activated, TTBR0_EL2 has the same bit assignments as TTBR0_EL1.

Bit fields and details that are not provided in this description are architecturally defined. See the [Arm® Architecture Reference Manual for A-profile architecture](#).

3.2.124 TTBR0_EL3, Translation Table Base Register 0, EL3

The TTBR0_EL3 holds the base address of the translation table for the stage 1 translation of memory accesses from EL3.

Bit field descriptions

TTBR0_EL3 is a 64-bit register.

Figure 3-107: TTBR0_EL3 bit assignments

RES0, [63:48]

RES0	Reserved
------	----------

BADDR[47:x], [47:1]

Translation table base address, bits[47:x]. Bits [x-1:1] are **RES0**.

x is based on the value of TCR_EL1.TOSZ, the stage of translation, and the memory translation granule size.

For instructions on how to calculate it, see the [Arm® Architecture Reference Manual for A-profile architecture](#).

The value of x determines the required alignment of the translation table, that must be aligned to 2^x bytes.

If bits $[x-1:1]$ are not all zero, this is a misaligned translation table base address. Its effects are **CONSTRAINED UNPREDICTABLE**, where bits $[x-1:1]$ are treated as if all the bits are zero. The value read back from those bits is the value written.

CnP, [0]

Common not Private. The possible values are:

0	CnP not supported
1	CnP supported

Configurations

There are no configuration notes.

Bit fields and details that are not provided in this description are architecturally defined. See the [Arm® Architecture Reference Manual for A-profile architecture](#).

3.2.125 TTBR1_EL1, Translation Table Base Register 1, EL1

The TTBR1_EL1 holds the base address of translation table 1, and information about the memory it occupies. This is one of the translation tables for the stage 1 translation of memory accesses at EL0 and EL1.

Bit field descriptions

TTBR1_EL1 is a 64-bit register.

Figure 3-108: TTBR1_EL1 bit assignments

ASID, [63:48]

An ASID for the translation table base address. The TCR_EL1.A1 field selects either TTBR0_EL1.ASID or TTBR1_EL1.ASID.

BADDR[47:x], [47:1]

Translation table base address, bits $[47:x]$. Bits $[x-1:0]$ are **RES0**.

x is based on the value of TCR_EL1.TOSZ, the stage of translation, and the memory translation granule size.

For instructions on how to calculate it, see the [Arm® Architecture Reference Manual for A-profile architecture](#).

The value of x determines the required alignment of the translation table, that must be aligned to 2^x bytes.

If bits $[x-1:1]$ are not all zero, this is a misaligned Translation Table Base Address. Its effects are **CONSTRAINED UNPREDICTABLE**, where bits $[x-1:1]$ are treated as if all the bits are zero. The value read back from those bits is the value written.

CnP, [0]

Common not Private. The possible values are:

0	CnP not supported
1	CnP supported

Configurations

There are no configuration notes.

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Architecture Reference Manual for A-profile architecture](#).

3.2.126 TTBR1_EL2, Translation Table Base Register 1, EL2

TTBR1_EL2 has the same format and contents as TTBR1_EL1.

See [3.2.125 TTBR1_EL1, Translation Table Base Register 1, EL1](#) on page 280.

3.2.127 VDISR_EL2, Virtual Deferred Interrupt Status Register, EL2

The VDISR_EL2 records that a virtual SError interrupt has been consumed by an `esb` instruction executed at Non-secure EL1.

Bit field descriptions

VDISR_EL2 is a 64-bit register, and is part of the *Reliability, Availability, Serviceability* (RAS) registers functional group.

Configurations

See [3.2.128 VDISR_EL2 at EL1](#) on page 281.

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Architecture Reference Manual for A-profile architecture](#).

3.2.128 VDISR_EL2 at EL1

VDISR_EL2 has a specific format when written at EL1.

The following figure shows the VDISR_EL2 bit assignments when written at EL1:

Figure 3-109: VDISR_EL2 at EL1 using AArch64

ISS, [23:0]

Contains the value from VESR_EL2, bits[23:0]

3.2.129 VESR_EL2, Virtual SError Exception Syndrome Register

The VESR_EL2 provides the syndrome value reported to software on taking a virtual SError interrupt exception.

Bit field descriptions

VESR_EL2 is a 64-bit register, and is part of:

- The Exception and fault handling registers functional group
- The Virtualization registers functional group

If the virtual SError interrupt is taken to EL1, VESR_EL2 provides the syndrome value reported in ESR_EL1.

VSESR_EL2 bit assignments

Figure 3-110: VSESR_EL2 bit assignments

RES0, [63:25]

RES0 Reserved

IDS, [24]

Indicates whether the deferred SError interrupt was of an **IMPLEMENTATION DEFINED** type. See ESR_EL1.IDS for a description of the functionality.

On taking a virtual SError interrupt to EL1 using AArch64 because HCR_EL2.VSE == 1, ESR_EL1[24] is set to VSESR_EL2.IDS.

ISS, [23:0]

Syndrome information. See ESR_EL1.ISS for a description of the functionality.

On taking a virtual SError interrupt to EL1 using AArch32 due to HCR_EL2.VSE == 1, ESR_EL1 [23:0] is set to VSESR_EL2.ISS.

Configurations

There are no configuration notes.

Bit fields and details that are not provided in this description are architecturally defined. See the [Arm® Architecture Reference Manual for A-profile architecture](#).

3.2.130 VTCR_EL2, Virtualization Translation Control Register, EL2

The VTCR_EL2 controls the translation table walks required for the stage 2 translation of memory accesses from Non-secure ELO and EL1.

It also holds cacheability and shareability information for the accesses.

Bit field descriptions

VTCR_EL2 is a 64-bit register, and is part of:

- The Virtualization registers functional group
- The Virtual memory control registers functional group

Figure 3-111: VTCR_EL2 bit assignments

Bits[28:25] and bits[22:21], architecturally defined, are implemented in the core.

3.3 Error system registers

This chapter describes the error registers accessed by the AArch64 error registers.

3.3.1 Error system register summary

This section identifies the ERRO* core error record registers accessed by the AArch64 ERX* error registers.

For those registers that are not described in this chapter, see the [Arm® Architecture Reference Manual for A-profile architecture](#).

The following table describes the architectural error record registers.

Table 3-95: Architectural error system register summary

Register mnemonic	Size	Register name	Access aliases from AArch64
ERROADDR	64	3.3.2 ERROADDR, Error Record Address Register on page 286	3.2.64 ERXADDR_EL1, Selected Error Record Address Register, EL1 on page 196
ERROCTLR	64	3.3.3 ERROCTLR, Error Record Control Register on page 287	3.2.65 ERXCTLR_EL1, Selected Error Record Control Register, EL1 on page 196
ERROFR	64	3.3.4 ERROFR, Error Record Feature Register on page 289	3.2.66 ERXFR_EL1, Selected Error Record Feature Register, EL1 on page 197

Register mnemonic	Size	Register name	Access aliases from AArch64
ERROMISCO	64	3.3.5 ERROMISCO, Error Record Miscellaneous Register 0 on page 291	3.2.67 ERXMISCO_EL1, Selected Error Record Miscellaneous Register 0, EL1 on page 197
ERROMISC1	64	3.3.6 ERROMISC1, Error Record Miscellaneous Register 1 on page 297	3.2.68 ERXMISC1_EL1, Selected Error Record Miscellaneous Register 1, EL1 on page 197
ERROSTATUS	32	3.3.10 ERROSTATUS, Error Record Primary Status Register on page 305	3.2.72 ERXSTATUS_EL1, Selected Error Record Primary Status Register, EL1 on page 201

The following table describes the error record registers that are **IMPLEMENTATION DEFINED**.

Table 3-96: IMPLEMENTATION DEFINED error system register summary

Register mnemonic	Size	Register name	Access aliases from AArch64
ERROPFGCDN	32	3.3.7 ERROPFGCDN, Error Pseudo Fault Generation Count Down Register on page 297	3.2.69 ERXPFGCDN_EL1, Selected Error Pseudo Fault Generation Count Down Register, EL1 on page 198
ERROPFGCTL	32	3.3.8 ERROPFGCTL, Error Pseudo Fault Generation Control Register on page 298	3.2.70 ERXPFGCTL_EL1, Selected Error Pseudo Fault Generation Control Register, EL1 on page 199

3.3.2 ERROADDR, Error Record Address Register

The ERROADDR stores the address that is associated to an error that is recorded.

Bit field descriptions

ERROADDR is a 64-bit register, and is part of the *Reliability, Availability, Serviceability* (RAS) registers functional group.

Figure 3-113: ERROADDR bit assignments

NS, [63]

Non-secure attribute. The possible values are:

0	The physical address is Secure.
1	The physical address is Non-secure.

RES0, [62:48]

RES0	Reserved
------	----------

PADDR, [47:0]

Physical address

Configurations

ERR0ADDR resets to **UNKNOWN**.

When ERRSELR_EL1.SEL==0, this register is accessible from [3.2.64 ERXADDR_EL1, Selected Error Record Address Register, EL1](#) on page 196.

3.3.3 ERROCTL, Error Record Control Register

The ERROCTL contains enable bits for the node that writes to this record:

- Enabling error detection and correction
- Enabling an error recovery interrupt
- Enabling a fault handling interrupt
- Enabling error recovery reporting as a read or write error response

Bit field descriptions

ERROCTL is a 64-bit register and is part of the *Reliability, Availability, Serviceability* (RAS) registers functional group.

ERROCTL resets to CFI [8], FI [3], UI [2], and ED[0] are **UNKNOWN**. The rest of the register is **RES0**.

Figure 3-114: ERROCTL bit assignments

RES0, [63:9]

RES0 Reserved

CFI, [8]

Fault handling interrupt for corrected errors enable.

The fault handling interrupt is generated when one of the standard CE counters on ERR0MISCO overflows and the overflow bit is set. The possible values are:

- | | |
|---|--|
| 0 | Fault handling interrupt not generated for corrected errors. |
| 1 | Fault handling interrupt generated for corrected errors. |

The interrupt is generated even if the error status is overwritten because the error record already records a higher priority error.

This applies to both reads and writes.

RES0, [7:4]

RES0	Reserved
-------------	----------

FI, [3]

Fault handling interrupt enable.

The fault handling interrupt is generated for all detected Deferred errors and Uncorrected errors. The possible values are:

0	Fault handling interrupt disabled
1	Fault handling interrupt enabled

UI, [2]

Uncorrected error recovery interrupt enable. When enabled, the error recovery interrupt is generated for all detected Uncorrected errors that are not deferred. The possible values are:

0	Error recovery interrupt disabled
1	Error recovery interrupt enabled

Applies to both reads and writes.

RES0, [1]

RES0	Reserved
-------------	----------

ED, [0]

Error Detection and correction enable. In Lock-mode, this bit is **RES0**. In Split-mode, the possible values are:

0	Error detection and correction disabled
1	Error detection and correction enabled

Configurations

This register is accessible from the following registers when ERRSELR_EL1.SEL==0:
[3.2.65 ERXCTLR_EL1, Selected Error Record Control Register, EL1](#) on page 196.

3.3.4 ERR0FR, Error Record Feature Register

The ERROFR defines which of the common architecturally defined features are implemented and, of the implemented features, which are software programmable.

Bit field descriptions

ERROFR is a 64-bit register, and is part of the *Reliability, Availability, Serviceability* (RAS) registers functional group.

The register is read-only.

Figure 3-115: ERR0FR bit assignments

RES0, [63:26]

RES0 Reserved

TS, [25:24]

Timestamp Extension. The value is:

0b00 The node does not support a timestamp register.

Critical error interrupt. Indicates whether the critical error interrupt and associated controls are implemented. The value is:

0b00	Does not support feature.
------	---------------------------

INJ, [21:20]

Fault Injection Extension. Indicates whether the standard fault injection mechanism is implemented. The value is:

0b00	The node does not support a standard fault injection mechanism.
------	---

CEO, [19:18]

Corrected Error Overwrite. The value is:

0b00 Counts CE if a counter is implemented and keeps the previous error status. If the counter overflows, `ERRORSTATUS.OF` is set to 1.

DUI, [17:16]

Error recovery interrupt for deferred errors. The value is:

0b00 The core does not support this feature.

RP, [15]

Repeat counter. The value is:

0b1 A first repeat counter and a second other counter are implemented.
The repeat counter is the same size as the primary error counter.

CEC, [14:12]

Corrected Error Counter. The value is:

0b010 The node implements an 8-bit standard CE counter in
ERROMISCO[39:32].

CFI, [11:10]

Fault handling interrupt for corrected errors. The value is:

0b10 The node implements a control for enabling fault handling interrupts
on corrected errors.

UE, [9:8]

In-band uncorrected error reporting. The value is:

0b01 The node implements in-band uncorrected error reporting, that is
External aborts.

FI, [7:6]

Fault handling interrupt. The value is:

0b10 The node implements a fault handling interrupt and implements
controls for enabling and disabling.

UI, [5:4]

Error recovery interrupt for uncorrected errors. The value is:

0b10 The node implements an error recovery interrupt and implements
controls for enabling and disabling.

DE, [3:2]

Defers errors. The value is:

0b00
Defers errors is always enabled for the node.

ED, [1:0]

Error detection and correction.

In Lock-mode, the value is:

0b01 Error detection and correction is always enabled for the node.

In Split-mode, the value is:

0b10 The node implements controls for enabling or disabling error detection and correction.

Configurations

In Lock-mode, ERROFR resets to 0x000000000000A9A1

In Split-mode, ERROFR resets to 0x000000000000A9A2

ERROFR is accessible from the following registers when ERRSEL_EL1.SEL==0:

[3.2.66 ERXFR_EL1, Selected Error Record Feature Register, EL1](#) on page 197.

3.3.5 ERR0MISCO, Error Record Miscellaneous Register 0

The ERR0MISCO is an error syndrome register. It contains corrected error counters, information to identify where the error was detected, and other state information not present in the corresponding status and address error record registers.

Bit field descriptions

ERR0MISCO is a 64-bit register, and is part of the *Reliability, Availability, Serviceability* (RAS) registers functional group.

In Lock mode, this register is RAZ.

Figure 3-116: ERR0MISCO bit assignments

**RES0, [63:48]**

RES0 Reserved

OFO, [47]

Sticky overflow bit, other. The possible values of this bit are:

0	Other counter has not overflowed.
1	Other counter has overflowed.

The fault handling interrupt is generated when the corrected fault handling interrupt is enabled and either overflow bit is set to 1.

CECO, [46:40]

Corrected error count, other. Incremented for each Corrected error that does not match the recorded syndrome.

This field resets to an **IMPLEMENTATION DEFINED** which might be **UNKNOWN** on a Cold reset. If the reset value is **UNKNOWN**, then the value of this field remains **UNKNOWN** until software initializes it.

OFR, [39]

Sticky overflow bit, repeat. The possible values of this bit are:

0	Repeat counter has not overflowed.
1	Repeat counter has overflowed.

The fault handling interrupt is generated when the corrected fault handling interrupt is enabled and either overflow bit is set to 1.

CECR, [38:32]

Corrected error count, repeat. Incremented for the first recorded error, which also records other syndromes, and then again for each Corrected error that matches the recorded syndrome.

This field resets to an **IMPLEMENTATION DEFINED** which might be **UNKNOWN** on a Cold reset. If the reset value is **UNKNOWN**, then the value of this field remains **UNKNOWN** until software initializes it.

WAY, [31:28]

The encoding depends on the unit from which the error being recorded was detected. The possible values are:

L1 Instruction Cache Tag

Indicates which way of the Instruction Cache TAG RAM detected the error. Upper two bits are unused.

L1 Instruction Data Cache

Indicates which way of the Instruction Cache Data RAM detected the error. Upper two bits are unused.

L0 Mop Cache

Indicates which way of the Mop Cache RAM detected the error. Upper two bits are unused.

L1 Data Cache Data

Indicates which way of the L1 Data Cache Data RAM detected the error. Upper two bits are unused.

L1 Data Cache Tag

Indicates which way of the Data Cache Tag RAM detected the error. Upper two bits are unused.

L2 TLB

Indicates which way of the L2 TLB RAM detected the error. Upper 1 bit is unused.

L2 Tag

Indicates the way of the L2 Tag RAM that detected the error. Upper 1 bit is unused.

L2 Data

Unused

L2 TQ

Unused

L2 CHI Slave

Unused

RES0, [27:26]

RES0	Reserved
-------------	----------

SUBBANK, [25]

The encoding depends on the unit from which the error being recorded was detected. The possible values are:

L1 Instruction Cache

Indicates which subbank has the error, valid for Instruction Data Cache, unused otherwise.

BANK, [24:23]

The encoding depends on the unit from which the error being recorded was detected. The possible values are:

L1 Instruction Cache Tag

Unused

L1 Instruction Data Cache

Indicates which bank (bank0 - bank3) detected the error.

L0 Mop Cache

Indicates which bank (bank0 - bank3) detected the error.

L1 Data Cache Data

Unused

L1 Data Cache Tag

Unused

L2 TLB

Unused

L2 Tag

Indicates which bank detected the error.

L2 Data

Indicates which bank detected the error.

L2 TQ

Indicates which bank detected the error.

L2 CHI Slave

Indicates which bank detected the error.

SUBARRAY, [22:19]

The encoding depends on the unit from which the error being recorded was detected. The possible values are:

L1 Instruction Cache Tag

Unused

L1 Instruction Data Cache

Unused

L0 Mop Cache

Unused

L1 Data Cache Data

Indicates the word that detected the error. Upper 1 bit is unused.

0b000	Word0
0b001	Word1
0b010	Word2
0b011	Word3
0b100	Word4
0b101	Word5
0b110	Word6
0b111	Word7

L1 Data Cache Tag

Indicates the bank that detected the error. Upper 1 bit is unused.

0b0000	bank0
0b0001	bank1

L2 TLB

Unused

L2 Tag

Unused

L2 Data

Indicates which doubleword detected the error. Upper 1 bit is unused.

0b000	DW0
0b001	DW1
0b010	DW2
0b011	DW3
0b100	DW4
0b101	DW5
0b110	DW6
0b111	DW7

L2 TQ

Indicates which doubleword detected the error. Upper 1 bit is unused.

0b000	DW0
0b001	DW1
0b010	DW2
0b011	DW3
0b100	DW4
0b101	DW5
0b110	DW6
0b111	DW7

L2 CHI Slave

0b0000	Copyback error response.
0b0001	Unferrable error when ECC is disabled.

INDEX, [18:6]

The encoding depends on the unit from which the error being recorded was detected. The possible values are:

L1 Instruction Cache Tag

Indicates which index of the cache reported the error. Upper bits are unused.

L1 Instruction Data Cache

Indicates which index of the cache reported the error. Upper bits are unused.

L0 Mop Cache

Indicates which index of the cache reported the error. Upper bits are unused.

L1 Data Cache Data

Indicates which index of the cache reported the error. Upper bits are unused.

L1 Data Cache Tag

Indicates which index of the cache reported the error. Upper bits are unused.

L2 TLB

Indicates which index of the cache reported the error. Upper bits are unused.

L2 Tag

Indicates which index of the cache reported the error. Upper bits are unused.

L2 Data

Indicates which index of the data RAM reported the error. Software reading this error record must decode this field as follows, where $L2_CACHE_SIZE_LOG = \text{CLOG2}(L2_CACHE_SIZE)$:

1. INDEX[18 : (L2_CACHE_SIZE_LOG + 3 + 6)] : **RESO**
2. INDEX[L2_CACHE_SIZE_LOG + 2 + 6 : 6] : Indicates the index of the cache line that reported the error.

L2 TQ

Indicates which entry of the L2TQ reported the error. Upper 8 bits are unused.

L2 CHI Slave

Unused

ARRAY, [5:4]

The encoding depends on the unit from which the error being recorded was detected. The possible values are:

L2 Cache

Indicates which array has the error. The possible values are:

0b00	L2 Tag RAM
0b01	L2 Data RAM
0b10	TQ Data RAM
0b11	CHI Slave Error

L1 Data Cache

Indicates which array detected the error. The possible values are:

0b00	LS0 copy of Tag RAM
0b01	LS1 copy of Tag RAM
0b10	LS Data RAM
0b11	LS2 copy of Tag RAM

L1 Instruction Cache

Indicates which array that detected the error, Data Array has higher priority. The possible values are:

0b00	Tag
0b01	Data
0b10	Mop cache

UNIT, [3:0]

Indicates the unit which detected the error. The possible values are:

0b0001	L1 Instruction Cache (Tag, Data, or Mop Cache)
0b0010	L2 TLB
0b0100	L1 Data Cache (Tag or Data)

0b1000 L2 Cache (Tag, Data, TQ, or CHI slave)

Configurations

ERR0MISC0 resets to [63:32] is 0x00000000, [31:0] is **UNKNOWN**.

This register is accessible from the following register when ERRSELR_EL1.SEL==0:

- [3.2.67 ERXMSCO_EL1, Selected Error Record Miscellaneous Register 0, EL1](#) on page 197.

3.3.6 ERR0MISC1, Error Record Miscellaneous Register 1

This register is unused in the Cortex[®]-A78AE core and marked as **RES0**.

Configurations

When ERRSEL_{EL1}.SEL==0, ERR0MISC1 is accessible from 3.2.68 ERXMISC1_EL1, Selected Error Record Miscellaneous Register 1, EL1 on page 197.

3.3.7 ERR0PFGCDN, Error Pseudo Fault Generation Count Down Register

ERR0PFGCDN is the Cortex®-A78AE node register that generates one of the errors that are enabled in the corresponding ERR0PFGCTL register.

Bit field descriptions

ERRORFGCDN is a 32-bit register and is RW.

Figure 3-117: ERR0PFGCDN bit assignments

CDN, [31:0]

Count Down value. The reset value of the Error Generation Counter is used for the countdown.

Configurations

There are no configuration options.

ERRORFGCDN resets to **UNKNOWN**.

When ERRSEL_{EL1}.SEL==0, ERRPGCDN is accessible from [3.2.69 ERXPGCDN_EL1](#), [Selected Error Pseudo Fault Generation Count Down Register, EL1](#) on page 198.

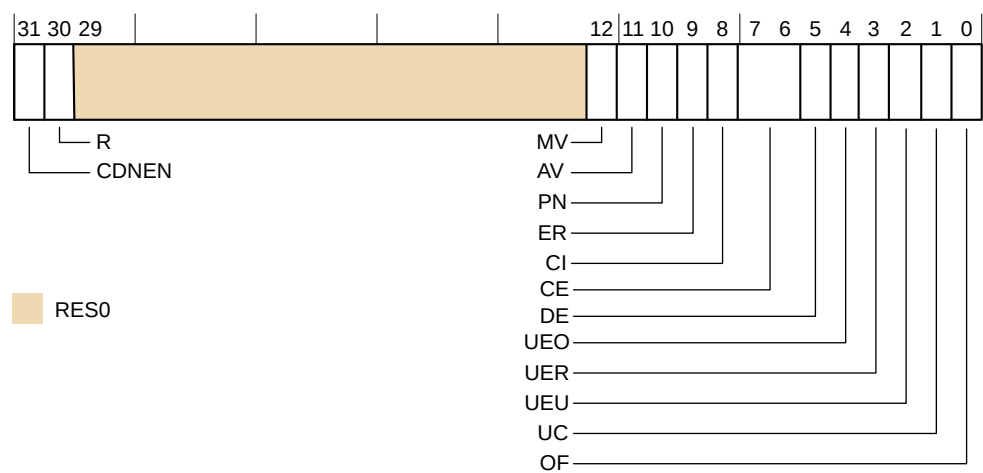

3.3.8 ERROPFGCTL, Error Pseudo Fault Generation Control Register

The ERROPFGCTL is the Cortex®-A78AE node register that enables controlled fault generation.

Bit field descriptions

ERROPFGCTL is a 32-bit read/write register.

Figure 3-118: ERROPFGCTL bit assignments

CDNEN, [31]

Count down enable. This bit controls transfers from the value that is held in the ERROPFGCDN into the Error Generation Counter and enables this counter to start counting down. The possible values are:

- | | |
|---|---|
| 0 | The Error Generation Counter is disabled. |
| 1 | The value that is held in the ERROPFGCDN register is transferred into the Error Generation Counter. The Error Generation Counter counts down. |

R, [30]

Restartable bit. When it reaches 0, the Error Generation Counter restarts from the ERROPFGCDN value or stops. The possible values are:

- | | |
|---|---|
| 0 | When it reaches 0, the counter stops. |
| 1 | When it reaches 0, the counter reloads the value that is stored in ERROPFGCDN and starts counting down again. |

RES0, [29:13]

RES0	Reserved
-------------	----------

MV, [12]

Miscellaneous syndrome. The value written to ERR<n>STATUS.MV when an injected error is recorded. The possible values of this bit are:

0	ERR<n>STATUS.MV is set to 0 when an injected error is recorded.
1	ERR<n>STATUS.MV is set to 0 when an injected error is recorded.

This bit reads-as-one if the node always records some syndrome in ERR<n>MISC<m>, setting ERR<n>STATUS.MV to 1, when an injected error is recorded. This bit is **RES0** if the node does not support this control.

This bit resets to an architecturally **UNKNOWN** value on a Cold reset. This bit is preserved on an Error Recovery reset.

AV, [11]

Address syndrome. The value written to ERR<n>STATUS.AV when an injected error is recorded. The possible values of this bit are:

0	ERR<n>STATUS.AV is set to 0 when an injected error is recorded.
1	ERR<n>STATUS.AV is set to 0 when an injected error is recorded.

This bit reads-as-one if the node always sets ERR<n>STATUS<m> to 1 when an injected error is recorded. This bit is **RES0** if the node does not support this control.

This bit resets to an architecturally **UNKNOWN** value on a Cold reset. This bit is preserved on an Error Recovery reset.

PN, [10]

Address syndrome. The value written to ERR<n>STATUS.PN when an injected error is recorded. The possible values of this bit are:

0	ERR<n>STATUS.PN is set to 0 when an injected error is recorded.
1	ERR<n>STATUS.PN is set to 0 when an injected error is recorded.

This bit is **RES0** if the node does not support this control.

This bit resets to an architecturally **UNKNOWN** value on a Cold reset. This bit is preserved on an Error Recovery reset.

ER, [9]

Address syndrome. The value written to ERR<n>STATUS.PN when an injected error is recorded. The possible values of this bit are:

0	ERR<n>STATUS.ER is set to 0 when an injected error is recorded.
1	ERR<n>STATUS.ER is set to 0 when an injected error is recorded.

This bit is **RES0** if the node does not support this control.

This bit resets to an architecturally **UNKNOWN** value on a Cold reset. This bit is preserved on an Error Recovery reset.

CI, [8]

Address syndrome. The value written to ERR<n>STATUS.CI when an injected error is recorded. The possible values of this bit are:

0	ERR<n>STATUS.CI is set to 0 when an injected error is recorded.
1	ERR<n>STATUS.CI is set to 0 when an injected error is recorded.

This bit is **RES0** if the node does not support this control.

This bit resets to an architecturally **UNKNOWN** value on a Cold reset. This bit is preserved on an Error Recovery reset.

CE, [7:6]

Corrected error generation enable. Controls the type of Corrected Error condition that might be generated. The possible values are:

00	No corrected error is generated.
01	A non-specific corrected error might be generated when the Error Generation Counter decrements to zero.
10	A transient corrected error might be generated when the Error Generation Counter decrements to zero.
11	A persistent corrected error might be generated when the Error Generation Counter decrements to zero.

The set of permitted values for this field is defined by ERR<n>PFGF.CE.

This field is **RES0** if the node does not support this control.

This field resets to an architecturally **UNKNOWN** value on a Cold reset. This field is preserved on an Error Recovery reset.

DE, [5]

Deferred Error generation enable. The possible values are:

0	No deferred error is generated.
1	A deferred error might be generated when the Error Generation Counter is triggered.

This bit is **RES0** if the node does not support this control.

This bit resets to an architecturally **UNKNOWN** value on a Cold reset. This bit is preserved on an Error Recovery reset.

UEO, [4]

Latent or Restartable Error generation enable. Controls whether this type of error condition might be generated. It is **IMPLEMENTATION DEFINED** whether the error is generated if the data is not consumed. The possible values are:

0	No error of this type will be generated.
1	An error of this type might be generated when the Error Generation Counter decrements to zero.

This bit is **RES0** if the node does not support this control.

This bit resets to an architecturally **UNKNOWN** value on a Cold reset. This bit is preserved on an Error Recovery reset.

UER, [3]

Signaled or Recoverable Error generation enable. Controls whether this type of error condition might be generated. It is **IMPLEMENTATION DEFINED** whether the error is generated if the data is not consumed. The possible values are:

0	No error of this type will be generated.
1	An error of this type might be generated when the Error Generation Counter decrements to zero.

This bit is **RES0** if the node does not support this control.

This bit resets to an architecturally **UNKNOWN** value on a Cold reset. This bit is preserved on an Error Recovery reset.

UEU, [2]

Unrecoverable Error generation enable. Controls whether this type of error condition might be generated. It is **IMPLEMENTATION DEFINED** whether the error is generated if the data is not consumed. The possible values are:

0	No error of this type will be generated.
1	An error of this type might be generated when the Error Generation Counter decrements to zero.

This bit is **RES0** if the node does not support this control.

This bit resets to an architecturally **UNKNOWN** value on a Cold reset. This bit is preserved on an Error Recovery reset.

UC, [1]

Uncontainable error generation enable. The possible values are:

0	No uncontainable error is generated.
1	An uncontainable error might be generated when the Error Generation Counter is triggered.

OF, [0]

Overflow flag. The value written to ERR<n>STATUS.OF when an injected error is recorded. The possible values of this bit are:

0	ERR<n>STATUS.OF is set to 0 when an injected error is recorded.
1	ERR<n>STATUS.OF is set to 0 when an injected error is recorded.

This bit is **RES0** if the node does not support this control.

This bit resets to an architecturally **UNKNOWN** value on a Cold reset. This bit is preserved on an Error Recovery reset.

Configurations

There are no configuration notes.

ERR0PFGCTL resets to 0x00000000.

ERR0PFGCTL is accessible from the following registers when ERRSELR_EL1.SEL==0:

- [3.2.70 ERXPFGCTL_EL1, Selected Error Pseudo Fault Generation Control Register, EL1](#) on page 199

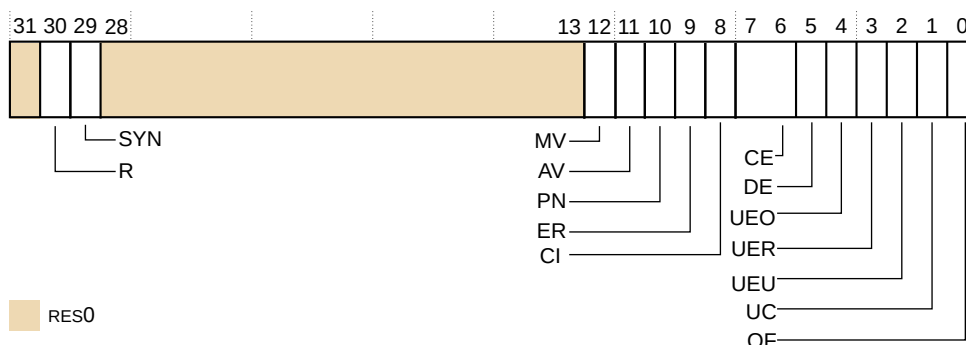

3.3.9 ERR0PFGF, Error Pseudo Fault Generation Feature Register

The ERR0PFGF is the Cortex®-A78AE node register that defines which fault generation features are implemented.

Bit field descriptions

ERR0PFGF is a 32-bit register and is RO.

Figure 3-119: ERR0PFGF bit assignments

RES0, [31]

RES0	Reserved
-------------	----------

R, [30]

Restartable bit. When it reaches zero, the Error Generation Counter restarts from the ERR0PFGCDN value or stops. The value is:

1	This feature is controllable.
----------	-------------------------------

SYN, [29]

Syndrome. Fault syndrome injection. The value is:

0	When an injected error is recorded, the node sets ERR<n>STATUS.{IERR, SERR} to IMPLEMENTATION DEFINED values. ERR<n>STATUS.{IERR, SERR} are UNKNOWN when ERR<n>STATUS.V is set to 0.
----------	--

RES0, [28:13]

RES0	Reserved
-------------	----------

MV, [12]

Miscellaneous syndrome. Additional syndrome injection. Defines whether software can control all or part of the syndrome recorded in the ERR<n>MISC<m> registers when an injected error is recorded. It is **IMPLEMENTATION DEFINED** which syndrome fields in ERR<n>MISC<m> this refers to, as some fields might always be recorded by an error, for example, a Corrected Error counter. The value is:

0	When an injected error is recorded, the node might record IMPLEMENTATION DEFINED additional syndrome in ERR<n>MISC<m>. If any syndrome is recorded in ERR<n>MISC<m>, then ERR<n>STATUS.MV is set to 1.
----------	---

AV, [11]

Address syndrome. Address syndrome injection. The value is:

0	When an injected error is recorded, the node either sets ERR<n>ADDR and ERR<n>STATUS.AV for the access or leaves these unchanged.
----------	---

PN, [10]

Poison flag. Describes how the fault generation feature of the node sets the ERR<n>STATUS.PN status flag. The value is:

0	When an injected error is recorded, the node sets ERR<n>STATUS.PN to 0.
----------	---

ER, [9]

Error Reported flag. Describes how the fault generation feature of the node sets the ERR<n>STATUS.ER status flag. The value is:

- | | |
|----------|---|
| 0 | When an injected error is recorded, the node sets ERR<n>STATUS.ER according to the architecture-defined rules for setting the ER bit. |
|----------|---|

CI, [8]

The value is:

- | | |
|----------|---|
| 0 | When an injected error is recorded, it is IMPLEMENTATION DEFINED whether the node sets ERR<n>STATUS.CI to 1. |
|----------|---|

CE, [7:6]

Corrected Error generation. The value is:

- | | |
|----------|-------------------------------|
| 1 | This feature is controllable. |
|----------|-------------------------------|

DE, [5]

Deferred Error generation. The value is:

- | | |
|----------|-------------------------------|
| 1 | This feature is controllable. |
|----------|-------------------------------|

UEO, [4]

Latent or Restartable Error generation. The value is:

- | | |
|----------|---|
| 0 | The node does not support this feature. |
|----------|---|

UER, [3]

Signaled or Recoverable Error generation. The value is:

- | | |
|----------|---|
| 0 | The node does not support this feature. |
|----------|---|

UEU, [2]

Unrecoverable Error generation. The value is:

- | | |
|----------|---|
| 0 | The node does not support this feature. |
|----------|---|

UC, [1]

Uncontainable Error generation. The value is:

- | | |
|----------|-------------------------------|
| 1 | This feature is controllable. |
|----------|-------------------------------|

OF, [0]

Overflow flag. The value is:

0

When an injected error is recorded, the node sets ERR<n>STATUS.OF according to the architecture-defined rules for setting the OF bit.

Configurations

There are no configuration notes.

ERROPFGFR resets to 0xC0000062.

When ERRSELR_EL1.SEL==0, ERROPFGFR is accessible from [3.2.71 ERXPFGF_EL1, Selected Pseudo Fault Generation Feature Register, EL1](#) on page 200.

3.3.10 ERROSTATUS, Error Record Primary Status Register

The ERROSTATUS contains information about the error record.

The register indicates whether:

- Any error has been detected.
- Any detected error was not corrected and returned to a master.
- Any detected error was not corrected and deferred.
- A second error of the same type was detected before software handled the first error.
- Any error has been reported.
- The other error record registers contain valid information.

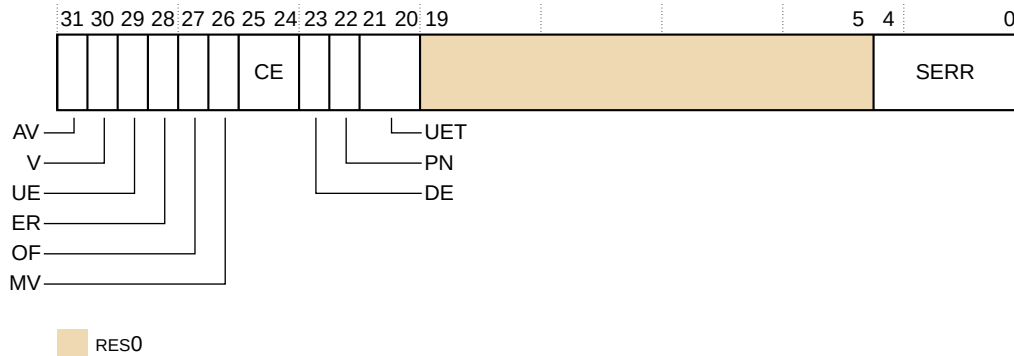

In Lock-mode, this register is RAZ.

Bit field descriptions

ERROSTATUS is a 32-bit register.

Figure 3-120: ERR0STATUS bit assignments

AV, [31]

Address Valid. The possible values are:

0	ERROADDR is not valid.
1	ERROADDR contains an address associated with the highest priority error recorded by this record.

V, [30]

Status Register valid. The possible values are:

0	ERROSTATUS is not valid.
1	ERROSTATUS is valid. At least one error has been recorded.

UE, [29]

Uncorrected error. The possible values are:

0	No error that could not be corrected or deferred has been detected.
1	At least one error that could not be corrected or deferred has been detected. If error recovery interrupts are enabled, then the interrupt signal is asserted until this bit is cleared.

ER, [28]

Error reported. The possible values are:

0	No External abort has been reported.
1	The node has reported an External abort to the master that is in access or making a transaction.

OF, [27]

Overflow. The possible values are:

- If $UE == 1$, then no error status for an Uncorrected error has been discarded.

- If UE == 0 and DE == 1, then no error status for a Deferred error has been discarded.
 - If UE == 0, DE == 0, and CE != 0b00, then:
The corrected error counter has not overflowed.
- 1** More than one error has occurred and so details of the other error have been discarded.

MV, [26]

Miscellaneous Registers Valid. The possible values are:

- | | |
|----------|---|
| 0 | ERRORMISC0 and ERRORMISC1 are not valid. |
| 1 | This bit indicates that ERRORMISC0 contains additional information about any error that is recorded by this record. |

CE, [25:24]

Corrected error. The possible values are:

- | | |
|-------------|---------------------------------------|
| 0b00 | No corrected error recorded |
| 0b10 | At least one corrected error recorded |

DE, [23]

Deferred error. The possible values are:

- | | |
|----------|--|
| 0 | No errors deferred |
| 1 | At least one error not corrected and deferred by poisoning |

PN, [22]

Poison. The value is:

- | | |
|----------|--|
| 0 | The Cortex®-A78AE core cannot distinguish a poisoned value from a corrupted value. |
|----------|--|

UET, [21:20]

Uncorrected Error Type. The value is:

- | | |
|-------------|---------------|
| 0b00 | Uncontainable |
|-------------|---------------|

RES0, [19:5]

- | | |
|-------------|----------|
| RES0 | Reserved |
|-------------|----------|

SERR, [4:0]

Primary error code. The possible values are:

- | | |
|------------|-------------------------------------|
| 0x0 | No error |
| 0x1 | IMPLEMENTATION DEFINED error |
| 0x2 | ECC error from internal data buffer |
| 0x6 | ECC error on cache data RAM |

0x7	ECC error on cache tag or dirty RAM
0x8	Parity error on TLB data RAM
0x12	Error response for a cache copyback
0x15	Deferred error from slave not supported at the consumer. For example, poisoned data received from a slave by a master that cannot defer the error further.

Note

Error injection functionality uses encodings 0x5 (tag) and 0x6 (data) in case of injected errors.

Configurations

There are no configuration notes.

ERROSTATUS resets to 0x00000000.

When ERRSELR_EL1.SEL==0, ERROSTATUS is accessible from [3.2.72 ERXSTATUS_EL1, Selected Error Record Primary Status Register, EL1](#) on page 201.

3.4 Generic Interrupt Controller registers

This chapter describes the *Generic Interrupt Controller* (GIC) registers.

3.4.1 CPU interface registers

Each CPU interface block provides the interface for the Cortex®-A78AE core that interfaces with a *Generic Interrupt Controller* (GIC) distributor within the system.

The Cortex®-A78AE core only supports System register access to the GIC CPU interface registers. The following table lists the three types of GIC CPU interface System registers supported in the Cortex®-A78AE core.

Table 3-97: GIC CPU interface System register types supported in the Cortex®-A78AE core

Register prefix	Register type
ICC	Physical GIC CPU interface System registers
ICV	Virtual GIC CPU interface System registers
ICH	Virtual interface control System registers

Access to virtual GIC CPU interface System registers is only possible at Non-secure EL1.

Access to ICC registers or the equivalent ICV registers is determined by HCR_EL2. See [3.2.77 HCR_EL2, Hypervisor Configuration Register, EL2](#) on page 206.

For more information on the CPU interface, see the [Arm® Generic Interrupt Controller Architecture Specification, GIC architecture version 3 and version 4](#).

3.4.2 AArch64 physical GIC CPU interface system register summary

The following table lists the AArch64 physical *Generic Interrupt Controller* (GIC) CPU interface System registers that have **IMPLEMENTATION DEFINED** bits.

See the [Arm® Generic Interrupt Controller Architecture Specification, GIC architecture version 3 and version 4](#) for more information and a complete list of AArch64 physical GIC CPU interface System registers.

Table 3-98: AArch64 physical GIC CPU interface System register summary

Name	Op0	Op1	CRn	CRm	Op2	Type	Description

3.4.3 ICC_AP0R0_EL1, Interrupt Controller Active Priorities Group 0 Register 0, EL1

The ICC_AP0R0_EL1 provides information about Group 0 active priorities.

Bit descriptions

This register is a 32-bit register and is part of:

- The GIC system registers functional group
- The GIC control registers functional group

The core implements 5 bits of priority with 32 priority levels, corresponding to the 32 bits [31:0] of the register. The possible values for each bit are:

0x00000000	No interrupt active. This is the reset value.
0x00000001	Interrupt active for priority 0x0
0x00000002	Interrupt active for priority 0x8
	...
0x80000000	Interrupt active for priority 0xF8

Details not provided in this description are architecturally defined. See the [Arm® Generic Interrupt Controller Architecture Specification, GIC architecture version 3 and version 4](#).

3.4.4 ICC_AP1R0_EL1, Interrupt Controller Active Priorities Group 1 Register 0 EL1

The ICC_AP1R0_EL1 provides information about Group 1 active priorities.

Bit descriptions

This register is a 32-bit register and is part of:

- The *Generic Interrupt Controller* (GIC) system registers functional group
- The GIC control registers functional group

The core implements 5 bits of priority with 32 priority levels, corresponding to the 32 bits [31:0] of the register. The possible values for each bit are:

0x00000000	No interrupt active. This is the reset value.
0x00000001	Interrupt active for priority 0x0
0x00000002	Interrupt active for priority 0x8
	...
0x80000000	Interrupt active for priority 0xF8

Details not provided in this description are architecturally defined. See the [Arm® Generic Interrupt Controller Architecture Specification, GIC architecture version 3 and version 4](#).

3.4.5 ICC_BPR0_EL1, Interrupt Controller Binary Point Register 0, EL1

ICC_BPR0_EL1 defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 0 interrupt preemption.

Bit field descriptions

ICC_BPR0_EL1 is a 32-bit register and is part of:

- The GIC system registers functional group
- The GIC control registers functional group

Figure 3-121: ICC_BPR0_EL1 bit assignments**RES0, [31:3]**

RES0 Reserved

BinaryPoint, [2:0]

The value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. The minimum value that is implemented is 0x2.

Bit fields and details that are not provided in this description are architecturally defined. See the [Arm® Generic Interrupt Controller Architecture Specification, GIC architecture version 3 and version 4](#).

3.4.6 ICC_BPR1_EL1, Interrupt Controller Binary Point Register 1, EL1

ICC_BPR1_EL1 defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 1 interrupt preemption.

Bit field descriptions

ICC_BPR1_EL1 is a 32-bit register and is part of:

- The GIC system registers functional group
- The GIC control registers functional group

Figure 3-122: ICC_BPR1_EL1 bit assignments**RES0, [31:3]**

RES0 Reserved

BinaryPoint, [2:0]

The value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field.

The minimum value implemented of ICC_BPR1_EL1 Secure register is 0x2.

The minimum value implemented of ICC_BPR1_EL1 Non-secure register is 0x3.

Bit fields and details that are not provided in this description are architecturally defined. See the [Arm® Generic Interrupt Controller Architecture Specification, GIC architecture version 3 and version 4](#).

3.4.7 ICC_CTLR_EL1, Interrupt Controller Control Register, EL1

ICC_CTLR_EL1 controls aspects of the behavior of the GIC CPU interface and provides information about the features implemented.

Bit field descriptions

ICC_CTLR_EL1 is a 32-bit register and is part of:

- The GIC System registers functional group
- The GIC control registers functional group

Figure 3-123: ICC_CTLR_EL1 bit assignments

RES0, [31:16]

RES0 Reserved

A3V, [15]

Affinity 3 Valid. The value is:

This field is an alias of ICC_CTLR_EL3.IDbits.

PRIbits, [10:8]

Priority bits. The value is:

0x4 The core supports 32 levels of physical priority with 5 priority bits.
Accesses to ICC_AP0R{1–3} and ICC_AP1R{1–3} are **UNDEFINED**.

RES0, [7]

RES0 Reserved

PMHE, [6]

Priority Mask Hint Enable. The possible values are:

0 Disables use of ICC_PMR as a hint for interrupt distribution.
1 Enables use of ICC_PMR as a hint for interrupt distribution.

RM, [5]

Routing Modifier. This bit is RAZ/WI.

EOImode_EL1NS, [4]

EOI mode for interrupts is handled at Non-secure EL1 and EL2.

Controls whether a write to an End of Interrupt register also deactivates the interrupt.

EOImode_EL1S, [3]

EOI mode for interrupts is handled at Secure EL1.

Controls whether a write to an End of Interrupt register also deactivates the interrupt.

EOImode_EL3, [2]

EOI mode for interrupts is handled at EL3.

Controls whether a write to an End of Interrupt register also deactivates the interrupt.

CBPR_EL1NS, [1]

Common Binary Point Register, EL1 Non-secure

Control whether the same register is used for interrupt preemption of both Group 0 and Group 1 Non-secure interrupts at EL1 and EL2.

CBPR_EL1S, [0]

Common Binary Point Register, EL1 Secure

Control whether the same register is used for interrupt preemption of both Group 0 and Group 1 Secure interrupt at EL1.

Bit fields and details that are not provided in this description are architecturally defined. See the [Arm® Generic Interrupt Controller Architecture Specification, GIC architecture version 3 and version 4](#).

3.4.9 ICC_SRE_EL1, Interrupt Controller System Register Enable Register, EL1

ICC_SRE_EL1 controls whether the System register interface or the memory-mapped interface to the GIC CPU interface is used for EL0 and EL1.

Bit field descriptions

ICC_SRE_EL1 is a 32-bit register and is part of:

- The GIC system registers functional group
- The GIC control registers functional group

3.4.13 ICV_AP0R0_EL1, Interrupt Controller Virtual Active Priorities Group 0 Register 0, EL1

The ICV_AP0R0_EL1 register provides information about virtual Group 0 active priorities.

Bit descriptions

This register is a 32-bit register and is part of the virtual GIC system registers functional group.

The core implements 5 bits of priority with 32 priority levels, corresponding to the 32 bits [31:0] of the register. The possible values for each bit are:

0x00000000

No interrupt active. This is the reset value.

0x00000001

Interrupt active for priority 0x0

0x00000002

Interrupt active for priority 0x8

...

0x80000000

Interrupt active for priority 0xF8

Details that are not provided in this description are architecturally defined. See the [Arm® Generic Interrupt Controller Architecture Specification, GIC architecture version 3 and version 4](#).

3.4.14 ICV_AP1R0_EL1, Interrupt Controller Virtual Active Priorities Group 1 Register 0, EL1

The ICV_AP1R0_EL1 register provides information about virtual Group 1 active priorities.

Bit descriptions

This register is a 32-bit register and is part of the virtual GIC system registers functional group.

The core implements 5 bits of priority with 32 priority levels, corresponding to the 32 bits [31:0] of the register. The possible values for each bit are:

0x00000000

No interrupt active. This is the reset value.

VM Group 1 Enabled Interrupt Enable. The possible values are:

- | | |
|----------|--|
| 0 | Maintenance interrupt disabled |
| 1 | Maintenance interrupt signaled when ICH_VMCR_EL2.VENG1 is 1. |

VGrp0DIE, [5]

VM Group 0 Disabled Interrupt Enable. The possible values are:

- | | |
|----------|--|
| 0 | Maintenance interrupt disabled |
| 1 | Maintenance interrupt signaled when ICH_VMCR_EL2.VENG0 is 0. |

VGrp0EIE, [4]

VM Group 0 Enabled Interrupt Enable. The possible values are:

- | | |
|----------|--|
| 0 | Maintenance interrupt disabled |
| 1 | Maintenance interrupt signaled when ICH_VMCR_EL2.VENG0 is 1. |

NPIE, [3]

No Pending Interrupt Enable. The possible values are:

- | | |
|----------|---|
| 0 | Maintenance interrupt disabled |
| 1 | Maintenance interrupt signaled while the List registers contain no interrupts in the pending state. |

LRENPIE, [2]

List Register Entry Not Present Interrupt Enable. The possible values are:

- | | |
|----------|--|
| 0 | Maintenance interrupt disabled |
| 1 | Maintenance interrupt is asserted while the EOIcount field is not 0. |

UIE, [1]

Underflow Interrupt Enable. The possible values are:

- | | |
|----------|--|
| 0 | Maintenance interrupt disabled |
| 1 | Maintenance interrupt is asserted if none, or only one, of the List register entries is marked as a valid interrupt. |

En, [0]

Enable. The possible values are:

- | | |
|----------|--|
| 0 | Virtual CPU interface operation disabled |
| 1 | Virtual CPU interface operation enabled |

Bit fields and details that are not provided in this description are architecturally defined. See the [Arm® Generic Interrupt Controller Architecture Specification, GIC architecture version 3 and version 4](#).

3.4.22 ICH_VMCR_EL2, Interrupt Controller Virtual Machine Control Register, EL2

ICH_VMCR_EL2 enables the hypervisor to save and restore the virtual machine view of the GIC state.

Bit field descriptions

ICH_VMCR_EL2 is a 32-bit register and is part of:

- The GIC system registers functional group
- The Virtualization registers functional group
- The GIC host interface control registers functional group

Figure 3-132: ICH_VMCR_EL2 bit assignments

VPMR, [31:24]

Virtual Priority Mask

This field is an alias of ICV_PMR_EL1.Priority.

VBPR0, [23:21]

Virtual Binary Point Register, Group 0. The minimum value is:

0x2

This field is an alias of ICV_BPR0_EL1.BinaryPoint.

VBPR1, [20:18]

Virtual Binary Point Register, Group 1. The minimum value is:

0x3

This field is an alias of ICV_BPR1_EL1.BinaryPoint.

RES0, [17:10]

RES0	Reserved
-------------	----------

VEOIM, [9]

Virtual EOI mode. The possible values are:

0x0	ICV_EOIR0_EL1 and ICV_EOIR1_EL1 provide both priority drop and interrupt deactivation functionality. Accesses to ICV_DIR_EL1 are UNPREDICTABLE .
0x1	ICV_EOIR0_EL1 and ICV_EOIR1_EL1 provide priority drop functionality only. ICV_DIR_EL1 provides interrupt deactivation functionality.

This bit is an alias of ICV_CTLR_EL1.EOImode.

RES0, [8:5]

RES0	Reserved
-------------	----------

VCBPR, [4]

Virtual Common Binary Point Register. The possible values are:

0x0	ICV_BPRO_EL1 determines the preemption group for virtual Group 0 interrupts only.
	ICV_BPR1_EL1 determines the preemption group for virtual Group 1 interrupts.
0x1	ICV_BPRO_EL1 determines the preemption group for both virtual Group 0 and virtual Group 1 interrupts.
	Reads of ICV_BPR1_EL1 return ICV_BPRO_EL1 plus one, saturated to 111. Writes to ICV_BPR1_EL1 are IGNORED .

VFIQEn, [3]

Virtual FIQ enable. The value is:

0x1	Group 0 virtual interrupts are presented as virtual FIQs.
------------	---

RES0, [2]

RES0	Reserved
-------------	----------

VENG1, [1]

Virtual Group 1 interrupt enable. The possible values are:

0x0	Virtual Group 1 interrupts are disabled.
0x1	Virtual Group 1 interrupts are enabled.

VENG0, [0]

Virtual Group 0 interrupt enable. The possible values are:

0x0	Virtual Group 0 interrupts are disabled.
0x1	Virtual Group 0 interrupts are enabled.

Bit fields and details that are not provided in this description are architecturally defined. See the [Arm® Generic Interrupt Controller Architecture Specification, GIC architecture version 3 and version 4](#).

3.4.23 ICH_VTR_EL2, Interrupt Controller VGIC Type Register, EL2

ICH_VTR_EL2 reports supported *Generic Interrupt Controller* (GIC) virtualization features.

Bit field descriptions

ICH_VTR_EL2 is a 32-bit register and is part of:

- The GIC System registers functional group
- The Virtualization registers functional group
- The GIC host interface control registers functional group

Figure 3-133: ICH_VTR_EL2 bit assignments

**PRIbits, [31:29]**

Priority bits. The number of virtual priority bits implemented, minus one.

0x4	Priority implemented is 5-bit.
------------	--------------------------------

PREbits, [28:26]

The number of virtual preemption bits implemented, minus one. The value is:

0x4	Virtual preemption implemented is 5-bit.
------------	--

IDbits, [25:23]

The number of virtual interrupt identifier bits supported. The value is:

0x0 Virtual interrupt identifier bits that are implemented is 16-bit.

SEIS, [22]

SEI Support. The value is:

0x0 The virtual CPU interface logic does not support generation of SEIs.

A3V, [21]

Affinity 3 Valid. The value is:

0x1 The virtual CPU interface logic supports non-zero values of Affinity 3 in SGI generation System registers.

nV4, [20]

Direct injection of virtual interrupts not supported. The value is:

0x0 The CPU interface logic supports direct injection of virtual interrupts.

TDS, [19]

Separate trapping of Non-secure EL1 writes to ICH_DIR_EL1 supported. The value is:

0x1 Implementation supports ICH_HCR_EL2.TDIR.

RES0, [18:5]

RES0 Reserved

ListRegs, [4:0]

0x3 The number of implemented List registers, minus one.

The core implements 4 list registers. Accesses to ICH_LR_EL2[x] (x>3) in AArch64 are **UNDEFINED**.

Bit fields and details that are not provided in this description are architecturally defined. See the [Arm® Generic Interrupt Controller Architecture Specification, GIC architecture version 3 and version 4](#).

3.5 Advanced SIMD and floating-point registers

This chapter describes the Advanced SIMD and floating-point registers.

3.5.1 AArch64 register summary

The core has several Advanced SIMD and floating-point system registers in the AArch64 Execution state. Each register has a specific purpose, specific usage constraints, configurations, and attributes.

The following table gives a summary of the Cortex®-A78AE core Advanced SIMD and floating-point system registers in the AArch64 Execution state.

Table 3-101: AArch64 Advanced SIMD and floating-point system registers

Name	Type	Reset	Description
FPCR	RW	0x00000000	3.5.2 FPCR, Floating-point Control Register on page 335
FPSR	RW	UNKNOWN	3.5.3 FPSR, Floating-point Status Register on page 337
MVFR0_EL1	RO	0x10110222	3.5.4 MVFR0_EL1, Media and VFP Feature Register 0, EL1 on page 339
MVFR1_EL1	RO	0x13211111	3.5.5 MVFR1_EL1, Media and VFP Feature Register 1, EL1 on page 341
MVFR2_EL1	RO	0x00000043	3.5.6 MVFR2_EL1, Media and VFP Feature Register 2, EL1 on page 343

3.5.2 FPCR, Floating-point Control Register

The FPCR controls floating-point behavior.

Bit field descriptions

FPCR is a 32-bit register.

Figure 3-134: FPCR bit assignments

RES0, [31:27]

RES0

Reserved

AHP, [26]

Alternative half-precision control bit. The possible values are:

- | | |
|---|---|
| 0 | IEEE half-precision format selected. This is the reset value. |
| 1 | Alternative half-precision format selected |

DN, [25]

Default NaN mode control bit. The possible values are:

- | | |
|---|--|
| 0 | NaN operands propagate through to the output of a floating-point operation. This is the reset value. |
| 1 | Any operation involving one or more NaNs returns the Default NaN. |

FZ, [24]

Flush-to-zero mode control bit. The possible values are:

- | | |
|---|--|
| 0 | Flush-to-zero mode disabled. Behavior of the floating-point system is fully compliant with the IEEE 754 standard. This is the reset value. |
| 1 | Flush-to-zero mode enabled |

RMode, [23:22]

Rounding Mode control field. The encoding of this field is:

- | | |
|-------------|---|
| 0b00 | <i>Round to Nearest (RN) mode. This is the reset value.</i> |
| 0b01 | <i>Round towards Plus Infinity (RP) mode</i> |
| 0b10 | <i>Round towards Minus Infinity (RM) mode</i> |
| 0b11 | <i>Round towards Zero (RZ) mode</i> |

Configurations

The named fields in this register map to the equivalent fields in the AArch32 FPSCR. See [3.5.8 FPSCR, Floating-Point Status and Control Register](#) on page 344.

Usage constraints

Accessing the FPCR

To access the FPCR:

```
MRS <Xt>, FPCR ; Read FPCR into Xt
MSR FPCR, <Xt> ; Write Xt to FPCR
```

Register access is encoded as follows:

Table 3-102: FPCR access encoding

op0	op1	CRn	CRm	op2
11	011	0100	0100	000

Accessibility

This register is accessible as follows:

ELO	EL1 (NS)	EL1 (S)	EL2	EL3 (SCR.NS = 1)	EL3 (SCR.NS = 0)
RW	RW	RW	RW	RW	RW

3.5.3 FPSR, Floating-point Status Register

The FPSR provides floating-point system status information.

Bit field descriptions

FPSR is a 32-bit register.

Figure 3-135: FPSR bit assignments

N, [31]

Negative condition flag for AArch32 floating-point comparison operations. AArch64 floating-point comparisons set the PSTATE.N flag instead.

Z, [30]

Zero condition flag for AArch32 floating-point comparison operations. AArch64 floating-point comparisons set the PSTATE.Z flag instead.

C, [29]

Carry condition flag for AArch32 floating-point comparison operations. AArch64 floating-point comparisons set the PSTATE.C flag instead.

V, [28]

Overflow condition flag for AArch32 floating-point comparison operations. AArch64 floating-point comparisons set the PSTATE.V flag instead.

QC, [27]

Cumulative saturation bit. This bit is set to 1 to indicate that an Advanced SIMD integer operation has saturated since a 0 was last written to this bit.

RES0, [26:8]

RES0	Reserved
------	----------

IDC, [7]

Input Denormal cumulative exception bit. This bit is set to 1 to indicate that the Input Denormal exception has occurred since 0 was last written to this bit.

RES0, [6:5]

RES0	Reserved
------	----------

IXC, [4]

Inexact cumulative exception bit. This bit is set to 1 to indicate that the Inexact exception has occurred since 0 was last written to this bit.

UFC, [3]

Underflow cumulative exception bit. This bit is set to 1 to indicate that the Underflow exception has occurred since 0 was last written to this bit.

OFC, [2]

Overflow cumulative exception bit. This bit is set to 1 to indicate that the Overflow exception has occurred since 0 was last written to this bit.

DZC, [1]

Division by Zero cumulative exception bit. This bit is set to 1 to indicate that the Division by Zero exception has occurred since 0 was last written to this bit.

IOC, [0]

Invalid Operation cumulative exception bit. This bit is set to 1 to indicate that the Invalid Operation exception has occurred since 0 was last written to this bit.

Configurations

The named fields in this register map to the equivalent fields in the AArch32 FPSCR. See [3.5.8 FPSCR, Floating-Point Status and Control Register](#) on page 344.

Usage constraints

Accessing the FPSR

To access the FPSR:

```
MRS <Xt>, FPSR; Read FPSR into Xt
MSR FPSR, <Xt>; Write Xt to FPSR
```

Register access is encoded as follows:

Table 3-104: FPSR access encoding

op0	op1	CRn	CRm	op2
11	011	0100	0100	001

Accessibility

This register is accessible as follows:

E0	EL1 (NS)	EL1 (S)	EL2	EL3 (SCR.NS = 1)	EL3 (SCR.NS = 0)
RW	RW	RW	RW	RW	RW

3.5.4 MVFR0_EL1, Media and VFP Feature Register 0, EL1

The MVFR0_EL1 describes the features provided by the AArch64 Advanced SIMD and floating-point implementation.

Bit field descriptions

MVFR0_EL1 is a 32-bit register.

Figure 3-136: MVFR0_EL1 bit assignments

FPRound, [31:28]

Indicates the rounding modes supported by the floating-point hardware:

0x1 All rounding modes supported

FPSHVec, [27:24]

Indicates the hardware support for floating-point short vectors:

0x0 Not supported

FPSqrt, [23:20]

Indicates the hardware support for floating-point square root operations:

0x1 Supported

FPDivide, [19:16]

Indicates the hardware support for floating-point divide operations:

0x1 Supported

FPTrap, [15:12]

Indicates whether the floating-point hardware implementation supports exception trapping:

0x0 Not supported

FPDP, [11:8]

Indicates the hardware support for floating-point double-precision operations:

0x2 Supported, VFPv3 or greater

See the [Arm® Architecture Reference Manual for A-profile architecture](#) for more information.

FPSP, [7:4]

Indicates the hardware support for floating-point single-precision operations:

0x2 Supported, VFPv3 or greater

See the [Arm® Architecture Reference Manual for A-profile architecture](#) for more information.

SIMDReg, [3:0]

Indicates support for the Advanced SIMD register bank:

0x2 Supported, 32 x 64-bit registers supported

See the [Arm® Architecture Reference Manual for A-profile architecture](#) for more information.

Configurations

There are no configuration notes.

Usage constraints**Accessing the MVFR0_EL1**

To access the MVFR0_EL1:

```
MRS <Xt>, MVFR0_EL1 ; Read MVFR0_EL1 into Xt
```

Register access is encoded as follows:

Table 3-106: MVFR0_EL1 access encoding

op0	op1	CRn	CRm	op2
11	000	0000	0011	000

Accessibility

This register is accessible as follows:

ELO	EL1(NS)	EL1(S)	EL2	EL3 (SCR.NS = 1)	EL3(SCR.NS = 0)
-	RO	RO	RO	RO	RO

3.5.5 MVFR1_EL1, Media and VFP Feature Register 1, EL1

The MVFR1_EL1 describes the features provided by the AArch64 Advanced SIMD and floating-point implementation.

Bit field descriptions

MVFR1_EL1 is a 32-bit register.

Figure 3-137: MVFR1_EL1 bit assignments

31	28	27	24	23	20	19	16	15	12	11	8	7	4	3	0

1 Implemented

FPHP, [27:24]

Indicates whether the Advanced SIMD and floating-point unit supports half-precision floating-point conversion instructions:

3 Floating-point half-precision conversion and data processing instructions implemented

SIMDHP, [23:20]

Indicates whether the Advanced SIMD and floating-point unit supports half-precision floating-point conversion operations:

- 2** Advanced SIMD half-precision conversion and data processing instructions implemented

SIMDSP, [19:16]

Indicates whether the Advanced SIMD and floating-point unit supports single-precision floating-point operations:

- 1** Implemented

SIMDInt, [15:12]

Indicates whether the Advanced SIMD and floating-point unit supports integer operations:

- 1** Implemented

SIMDLS, [11:8]

Indicates whether the Advanced SIMD and floating-point unit supports load/store instructions:

- 1** Implemented

FPDNaN, [7:4]

Indicates whether the floating-point hardware implementation supports only the Default NaN mode:

- 1** Hardware supports propagation of NaN values.

FPFtZ, [3:0]

Indicates whether the floating-point hardware implementation supports only the Flush-to-zero mode of operation:

- 1** Hardware supports full denormalized number arithmetic.

Configurations

There are no configuration notes.

Usage constraints

Accessing the MVFR1_EL1

To access the MVFR1_EL1:

```
MRS <Xt>, MVFR1_EL1 ; Read MVFR1_EL1 into Xt
```

Register access is encoded as follows:

Table 3-108: MVFR1_EL1 access encoding

op0	op1	CRn	CRm	op2
11	000	0000	0011	001

Accessibility

This register is accessible as follows:

EL0	EL1(NS)	EL1(S)	EL2	EL3 (SCR.NS = 1)	EL3(SCR.NS = 0)
-	RO	RO	RO	RO	RO

3.5.6 MVFR2_EL1, Media and VFP Feature Register 2, EL1

The MVFR2_EL1 describes the features provided by the AArch64 Advanced SIMD and floating-point implementation.

Bit field descriptions

MVFR2_EL1 is a 32-bit register.

Figure 3-138: MVFR2_EL1 bit assignments

RES0, [31:8]

RES0 Reserved

FPMisc, [7:4]

Indicates support for miscellaneous floating-point features.

0x4 Supports:

- Floating-point selection
- Floating-point Conversion to Integer with Directed Rounding modes
- Floating-point Round to Integral Floating-point
- Floating-point MaxNum and MinNum

SIMD Misc, [3:0]

Indicates support for miscellaneous Advanced SIMD features.

0x3 Supports:

- Floating-point Conversion to Integer with Directed Rounding modes
- Floating-point Round to Integral Floating-point
- Floating-point MaxNum and MinNum

Configurations

There are no configuration notes.

Usage constraints

Accessing the MVFR2_EL1

To access the MVFR2_EL1:

```
MRS <Xt>, MVFR2_EL1 ; Read MVFR2_EL1 into Xt
```

Register access is encoded as follows:

Table 3-110: MVFR2_EL1 access encoding

op0	op1	CRn	CRm	op2
11	000	0000	0011	010

Accessibility

This register is accessible as follows:

EL0	EL1(NS)	EL1(S)	EL2	EL3 (SCR.NS = 1)	EL3(SCR.NS = 0)
-	RO	RO	RO	RO	RO

3.5.7 AArch32 register summary

The core has one Advanced SIMD and floating-point System registers in the AArch32 Execution state.

The following table gives a summary of the Cortex®-A78AE core Advanced SIMD and floating-point System registers in the AArch32 Execution state.

Table 3-112: AArch32 Advanced SIMD and floating-point system registers

Name	Type	Reset	Description
FPSCR	RW	UNKNOWN	3.5.8 FPSCR, Floating-Point Status and Control Register on page 344

See the [Arm® Architecture Reference Manual for A-profile architecture](#) for information on permitted accesses to the Advanced SIMD and floating-point System registers.

3.5.8 FPSCR, Floating-Point Status and Control Register

The FPSCR provides floating-point system status information and control.

Bit field descriptions

FPSCR is a 32-bit register.

Figure 3-139: FPSCR bit assignments

N, [31]

Floating-point Negative condition code flag

Set to 1 if a floating-point comparison operation produces a less than result.

Z, [30]

Floating-point Zero condition code flag

Set to 1 if a floating-point comparison operation produces an equal result.

C, [29]

Floating-point Carry condition code flag

Set to 1 if a floating-point comparison operation produces an equal, greater than, or unordered result.

V, [28]

Floating-point Overflow condition code flag

Set to 1 if a floating-point comparison operation produces an unordered result.

QC, [27]

Cumulative saturation bit

This bit is set to 1 to indicate that an Advanced SIMD integer operation has saturated after 0 was last written to this bit.

AHP, [26]

Alternative Half-Precision control bit:

- | | |
|----------|---|
| 0 | IEEE half-precision format selected. This is the reset value. |
| 1 | Alternative half-precision format selected |

DN, [25]

Default NaN mode control bit:

- | | |
|----------|--|
| 0 | NaN operands propagate through to the output of a floating-point operation. This is the reset value. |
| 1 | Any operation involving one or more NaNs returns the Default NaN. |

The value of this bit only controls floating-point arithmetic. AArch32 Advanced SIMD arithmetic always uses the Default NaN setting, regardless of the value of the DN bit.

FZ, [24]

Flush-to-zero mode control bit:

- | | |
|----------|--|
| 0 | Flush-to-zero mode disabled. Behavior of the floating-point system is fully compliant with the IEEE 754 standard. This is the reset value. |
| 1 | Flush-to-zero mode enabled. |

The value of this bit only controls floating-point arithmetic. AArch32 Advanced SIMD arithmetic always uses the Flush-to-zero setting, regardless of the value of the FZ bit.

RMode, [23:22]

Rounding Mode control field:

- | | |
|-------------|---|
| 0b00 | <i>Round to Nearest (RN) mode. This is the reset value.</i> |
| 0b01 | <i>Round towards Plus Infinity (RP) mode</i> |
| 0b10 | <i>Round towards Minus Infinity (RM) mode</i> |
| 0b11 | <i>Round towards Zero (RZ) mode</i> |

The specified rounding mode is used by almost all floating-point instructions. AArch32 Advanced SIMD arithmetic always uses the Round to Nearest setting, regardless of the value of the RMode bits.

IXC, [4]

Inexact cumulative exception bit. This bit is set to 1 to indicate that the Inexact exception has occurred since 0 was last written to this bit.

UFC, [3]

Underflow cumulative exception bit. This bit is set to 1 to indicate that the Underflow exception has occurred since 0 was last written to this bit.

OFC, [2]

Overflow cumulative exception bit. This bit is set to 1 to indicate that the Overflow exception has occurred since 0 was last written to this bit.

DZC, [1]

Division by Zero cumulative exception bit. This bit is set to 1 to indicate that the Division by Zero exception has occurred since 0 was last written to this bit.

IOC, [0]

Invalid Operation cumulative exception bit. This bit is set to 1 to indicate that the Invalid Operation exception has occurred since 0 was last written to this bit.

Configurations

There is one copy of this register that is used in both Secure and Non-secure states.

The named fields in this register map to the equivalent fields in the AArch64 FPCR and FPSR. See [3.5.2 FPCR, Floating-point Control Register](#) on page 335 and [3.5.3 FPSR, Floating-point Status Register](#) on page 337.

Usage constraints

Accessing the FPSCR

To access the FPSCR:

```
VMRS <Rt>, FPSCR ; Read FPSCR into Rt
```

VMSR FPSCR, <Rt> ; Write Rt to FPSCR

Register access is encoded as follows:

Table 3-113: FPSCR access encoding

spec_reg
0001

The Cortex®-A78AE core implementation does not support the deprecated VFP short vector feature. Attempts to execute the associated VFP data-processing instructions result in an **UNDEFINED** Instruction exception.

Accessibility

This register is accessible as follows:

EL0 (NS)	EL0 (S)	EL1 (NS)	EL1 (S)	EL2	EL3 (SCR.NS = 1)	EL3 (SCR.NS = 0)
Config	RW	-	-	-	-	-

Access to this register depends on the values of CPACR_EL1.FPEN, CPTR_EL2.FPEN, CPTR_EL2.TFP, CPTR_EL3.TFP, and HCR_EL2.{E2H, TGE}. For details of which values of these fields allow access at which Exception levels, see the [Arm® Architecture Reference Manual for A-profile architecture](#).

4. Debug descriptions

This part describes the debug functionality of the Cortex®-A78AE core.

4.1 Debug

This chapter describes the Cortex®-A78AE core debug registers and shows examples of how to use them.

4.1.1 About debug methods

The core is part of a debug system and supports both self-hosted and external debug.

The following figure shows a typical external debug system.

Figure 4-1: External debug system

Debug host

A computer, for example a personal computer, that is running a software debugger. With the debug host, you can issue high-level commands, such as setting a breakpoint at a certain location or examining the contents of a memory address.

Protocol converter

The debug host sends messages to the debug target using an interface such as Ethernet. However, the debug target typically implements a different interface protocol. A device such as DSTREAM is required to convert between the two protocols.

Debug target

The lowest level of the system implements system support for the protocol converter to access the debug unit using the *Advanced Peripheral Bus* (APB) slave interface. An example of a debug target is a development system with a test chip or a silicon part with a core.

Debug unit

Helps debugging software that is running on the core:

- Hardware systems that are based on the core
- Operating systems
- Application software

With the debug unit, you can:

- Stop program execution
- Examine and alter process and coprocessor state
- Examine and alter memory and the state of the input or output peripherals
- Restart the core

For self-hosted debug, the debug target runs additional debug monitor software that runs on the Cortex®-A78AE core itself. This way, it does not require expensive interface hardware to connect a second host computer.

4.1.2 Debug register interfaces

The Debug architecture defines a set of Debug registers.

The Debug register interfaces provide access to these registers from:

- Software running on the core
- An external debugger

The Cortex®-A78AE core implements the Armv8 Debug architecture and debug events as described in the [Arm® Architecture Reference Manual for A-profile architecture](#). It also implements improvements to Debug introduced in Armv8.1 and Armv8.2.

4.1.2.1 Core interfaces

System register access allows the core to directly access certain Debug registers.

Debug registers

This function is System register based and memory-mapped. You can access the Debug register map using the APB slave port. The external debug interface enables both external and self-hosted debug agents to access Debug registers.

Performance monitor

This function is System register based and memory-mapped. You can access the performance monitor registers using the APB slave port.

Activity monitor

This function is System register based and memory-mapped. You can access the activity monitor registers using the APB slave port.

Trace registers

This function is memory-mapped.

ELA registers

This function is memory-mapped.

4.1.2.2 Breakpoints and watchpoints

The core supports six breakpoints, four watchpoints, and a standard *Debug Communications Channel* (DCC).

A breakpoint consists of a breakpoint control register and a breakpoint value register. These two registers are referred to as a *Breakpoint Register Pair* (BRP).

Four of the breakpoints (BRP 0 - BRP 3) match only to virtual address and the other two breakpoints (BRP 4 - BRP 5) match against either virtual address or context ID, or VMID. All the watchpoints can be linked to two breakpoints (BRP 4 - BRP 5) to enable a memory request to be trapped in a given process context.

4.1.2.3 Effects of resets on debug registers

The core has the following reset signals that affect the Debug registers:

nCPUPORESET

This signal initializes the core processing logic, including the debug, ETM trace unit, breakpoint, watchpoint logic, and performance monitors logic. This maps to a Cold reset that covers reset of the core processing logic and the integrated debug functionality.

nCORERESET

This signal resets some of the debug and performance monitor logic. This maps to a Warm reset that covers reset of the core processing logic, with the exception of debug.

4.1.2.4 External access permissions to debug registers

External access permission to the Debug registers is subject to the conditions at the time of the access.

The following table describes the core response to accesses through the external debug interface.

Table 4-1: External access conditions to registers

Name	Condition	Description
Off	EDPRSR.PU is 0	Core power domain is completely off, or in a low-power state where the core power domain registers cannot be accessed. If debug power is off, then all external debug and memory-mapped register accesses return an error.
DLK	DoubleLockStatus() == TRUE (EDPRSR.DLK is 1)	OS Double Lock is locked.
OSLK	OSLSR_EL1.OSLK is 1	OS Lock is locked.
EDAD	AllowExternalDebugAccess() == FALSE	External debug access is disabled. When an error is returned because of an EDAD condition code, and this is the highest priority error condition, EDPRSR.SDAD is set to 1. Otherwise SDAD is unchanged.
Default	-	None of the conditions apply, normal access.

The following table shows an example of external register access condition codes for access to a performance monitor register. To determine the access permission for the register, scan the columns from left to right. Stop at the first column a condition is true, the entry gives the access permission of the register and scanning stops.

Table 4-2: External register condition code example

Off	DLK	OSLK	EDAD	Default
-	-	-	-	RO

4.1.3 Debug events

A debug event can be a software debug event or a Halting debug event.

A core responds to a debug event in one of the following ways:

- Ignores the debug event
- Takes a debug exception
- Enters Debug state

See the [Arm® Architecture Reference Manual for A-profile architecture](#) for more information about the debug events.

Related information

[About clocks, resets, and input synchronization](#) on page 33

[External debug interface](#) on page 353

4.1.3.1 Watchpoint debug events

In the Cortex®-A78AE core, watchpoint debug events are always synchronous.

Memory hint instructions and cache clean operations, except `dc zva` and `dc ivac`, do not generate watchpoint debug events. Store exclusive instructions generate a watchpoint debug event even when the check for the control of exclusive monitor fails. Atomic CAS instructions generate a watchpoint debug event even when the compare operation fails.

4.1.3.2 Debug OS Lock

Debug OS Lock is set by the powerup reset, `nCPUPORESET`.

For normal behavior of debug events and Debug register accesses, Debug OS Lock must be cleared. For more information, see the [Arm® Architecture Reference Manual for A-profile architecture](#).

4.1.4 External debug interface

For information on external debug interface, including debug memory map and debug signals, see the Debug registers and Signal descriptions in the *Arm® DynamIQ™ Shared Unit AE Technical Reference Manual*.

4.2 Performance Monitoring Unit

This chapter describes the *Performance Monitoring Unit* (PMU) and the registers that it uses.

4.2.1 About the PMU

The Cortex®-A78AE core includes performance monitors that enable you to gather various statistics on the operation of the core and its memory system during runtime. These provide useful information about the behavior of the core that you can use when debugging or profiling code.

Each processing element has its own *Performance Monitoring Unit* (PMU). The PMU provides six counters. Each counter can count any of the events available in the core. The absolute counts recorded might vary because of pipeline effects. This has negligible effect except in cases where the counters are enabled for a very short time.

Related information

[PMU events](#) on page 354

4.2.2 PMU functional description

This section describes the functionality of the *Performance Monitoring Unit* (PMU).

The PMU includes the following interfaces and counters:

Event interface

Events from all other units from across the design are provided to the PMU.

System register and APB interface

You can program the PMU registers using the System registers or the external APB interface.

Counters

The PMU has 32-bit counters that increment when they are enabled, based on events, and a 64-bit cycle counter.

PMU register interfaces

The Cortex®-A78AE core supports access to the performance monitor registers from the internal System register interface and a memory-mapped interface.

4.2.2.1 External register access permissions

Whether or not access is permitted to a register depends on:

- If the core is powered up
- The state of the OS Lock and OS Double Lock
- The state of External Performance Monitors access disable
- The state of the debug authentication inputs to the core

The behavior is specific to each register and is not described in this document. For a detailed description of these features and their effects on the registers, see the *Arm® Architecture Reference Manual Arm®v8, for Arm®v8-A architecture profile*.

The register descriptions provided in this manual describe whether each register is read/write or read-only.

4.2.3 PMU events

The following table shows the events that are generated and the numbers that the *Performance Monitoring Unit* (PMU) uses to reference the events. The table also shows the bit position of each event on the event bus. Event reference numbers that are not listed are reserved.

Table 4-3: PMU Events

Event number	PMU event bus (to trace)	Event mnemonic	Event description
0x0	[00]	SW_INCR	Software increment. Instruction architecturally executed (condition code check pass).
0x1	[01]	L1I_CACHE_REFILL	<p>L1 instruction cache refill. This event counts any instruction fetch which misses in the cache.</p> <p>The following instructions are not counted:</p> <ul style="list-style-type: none"> Cache maintenance instructions Non-cacheable accesses
0x2	[02]	L1I_TLB_REFILL	<p>L1 instruction TLB refill. This event counts any refill of the instruction L1 TLB from the L2 TLB. This includes refills that result in a translation fault.</p> <p>The following instructions are not counted:</p> <ul style="list-style-type: none"> TLB maintenance instructions <p>This event counts regardless of whether the MMU is enabled.</p>
0x3	[03]	L1D_CACHE_REFILL	<p>L1 data cache refill. This event counts any load or store operation or translation table walk access which causes data to be read from outside the L1, including accesses which do not allocate into L1.</p> <p>The following instructions are not counted:</p> <ul style="list-style-type: none"> Cache maintenance instructions and prefetches Stores of an entire cache line, even if they make a coherency request outside the L1 Partial cache line writes which do not allocate into the L1 cache Non-cacheable accesses. <p>This event counts the sum of L1D_CACHE_REFILL_RD and L1D_CACHE_REFILL_WR.</p>
0x4	[06:04]	L1D_CACHE	<p>L1 data cache access. This event counts any load or store operation or translation table walk access which looks up in the L1 data cache. In particular, any access which could count the L1D_CACHE_REFILL event causes this event to count.</p> <p>The following instructions are not counted:</p> <ul style="list-style-type: none"> Cache maintenance instructions and prefetches Non-cacheable accesses <p>This event counts the sum of L1D_CACHE_RD and L1D_CACHE_WR.</p>

Event number	PMU event bus (to trace)	Event mnemonic	Event description
0x5	[08:07]	L1D_TLB_REFILL	<p>L1 data TLB refill. This event counts any refill of the data L1 TLB from the L2 TLB. This includes refills that result in a translation fault. The following instructions are not counted:</p> <ul style="list-style-type: none"> • TLB maintenance instructions <p>This event counts regardless of whether the MMU is enabled.</p>
0x8	[13:9]	INST_RETIRED	Instruction architecturally executed. This event counts all retired instructions, including those that fail their condition check.
0x9	[14]	EXC_TAKEN	Exception taken
0x0A	[15]	EXC_RETURN	Instruction architecturally executed, condition code check pass, exception return
0x0B	[16]	CID_WRITE_RETIRED	<p>Instruction architecturally executed, condition code check pass, write to CONTEXTIDR. This event only counts writes to CONTEXTIDR in AArch32 state, and via the CONTEXTIDR_EL1 mnemonic in AArch64 state.</p> <p>The following instructions are not counted:</p> <ul style="list-style-type: none"> • Writes to CONTEXTIDR_EL12 and CONTEXTIDR_EL2
0x10	[17]	BR_MIS_PRED	Mispredicted or not predicted branch speculatively executed. This event counts any predictable branch instruction which is mispredicted either due to dynamic misprediction or because the MMU is off and the branches are statically predicted not taken.
0x11	[18]	CPU_CYCLES	Cycle
0x12	[20:19]	BR_PRED	Predictable branch speculatively executed. This event counts all predictable branches.
0x13	[23:21]	MEM_ACCESS	<p>Data memory access. This event counts memory accesses due to load or store instructions.</p> <p>The following instructions are not counted:</p> <ul style="list-style-type: none"> • Instruction fetches • Cache maintenance instructions • Translation table walks or prefetches <p>This event counts the sum of MEM_ACCESS_RD and MEM_ACCESS_WR.</p>
0x14	[24]	L1I_CACHE	<p>L1 instruction cache access or L0 Macro-op cache access. This event counts any instruction fetch which accesses the L1 instruction cache or L0 Macro-op cache.</p> <p>The following instructions are not counted:</p> <ul style="list-style-type: none"> • Cache maintenance instructions • Non-cacheable accesses

Event number	PMU event bus (to trace)	Event mnemonic	Event description
0x15		L1D_CACHE_WB	<p>L1 data cache Write-Back. This event counts any write-back of data from the L1 data cache to L2 or L3. This counts both victim line evictions and snoops, including cache maintenance operations.</p> <p>The following instructions are not counted:</p> <ul style="list-style-type: none"> Invalidations which do not result in data being transferred out of the L1[25] Full-line writes which write to L2 without writing L1, such as write streaming mode
0x16	[29:26]	L2D_CACHE	[25]L2 unified cache access. This event counts any transaction from L1 which looks up in the L2 cache, and any write-back from the L1 to the L2. Snoops from outside the core and cache maintenance operations are not counted.
0x17	[33:30]	L2D_CACHE_REFILL	L2 unified cache refill. This event counts any Cacheable transaction from L1 which causes data to be read from outside the core. L2 refills caused by stashes and prefetches that target this level of cache, should not be counted.
0x18	[37:34]	L2D_CACHE_WB	L2 unified cache write-back. This event counts any write-back of data from the L2 cache to outside the core. This includes snoops to the L2 which return data, regardless of whether they cause an invalidation. Invalidations from the L2 which do not write data outside of the core and snoops which return data from the L1 are not counted.
0x19	[39:38]	BUS_ACCESS	Bus access. This event counts for every beat of data transferred over the data channels between the core and the SCU. If both read and write data beats are transferred on a given cycle, this event is counted twice on that cycle. This event counts the sum of BUS_ACCESS_RD and BUS_ACCESS_WR.
0x1A	[40]	MEMORY_ERROR	Local memory error. This event counts any correctable or uncorrectable memory error (ECC or parity) in the protected core RAMs.
0x1B	[45:41]	INST_SPEC	Operation speculatively executed
0x1C	[46]	TTBR_WRITE_RETIRED	<p>Instruction architecturally executed, condition code check pass, write to TTBR. This event only counts writes to TTBR0/TTBR1 in AArch32 state and TTBR0_EL1/TTBR1_EL1 in AArch64 state.</p> <p>The following instructions are not counted:</p> <ul style="list-style-type: none"> Accesses to TTBR0_EL12/TTBR1_EL12 or TTBR0_EL2/TTBR1_EL2
0x1D	[47]	BUS_MASTER_CYCLE	Bus cycles. This event duplicates CPU_CYCLES.
0x1E	[48]	COUNTER_OVERFLOW	For odd-numbered counters, increments the count by one for each overflow of the preceding even-numbered counter. For even-numbered counters, there is no increment.
0x20	[51:49]	CACHE_ALLOCATE	L2 unified cache allocation without refill. This event counts any full cache line write into the L2 cache which does not cause a linefill, including write-backs from L1 to L2 and full-line writes which do not allocate into L1.
0x21	[55:52]	BR_RETIRED	Instruction architecturally executed, branch. This event counts all branches, taken or not. This excludes exception entries, debug entries and CCFAIL branches.
0x22	[59:56]	BR_MIS_PRED_RETIRED	Instruction architecturally executed, mispredicted branch. This event counts any branch counted by BR_RETIRED which is not correctly predicted and causes a pipeline flush.
0x23	[60]	STALL_FRONTEND	No operation issued because of the frontend. The counter counts on any cycle when there are no fetched instructions available to dispatch.

Event number	PMU event bus (to trace)	Event mnemonic	Event description
0x24	[61]	STALL_BACKEND	No operation issued because of the backend. The counter counts on any cycle fetched instructions are not dispatched due to resource constraints.
0x25	[64:62]	L1D_TLB	L1 data TLB access. This event counts any load or store operation which accesses the data L1 TLB. If both a load and a store are executed on a cycle, this event counts twice. This event counts regardless of whether the MMU is enabled.
0x26	[65]	L1I_TLB	L1 instruction TLB access. This event counts any instruction fetch which accesses the instruction L1 TLB. This event counts regardless of whether the MMU is enabled.
0x29	[66]	L3D_CACHE_ALLOCATE	Read attributable L3 data or unified cache allocation without refill. This event counts any full cache line write into the L3 cache which does not cause a linefill, including write-backs from L2 to L3 and full-line writes which do not allocate into L2.
0x2A	[69:67]	L3D_CACHE_REFILL	Attributable L3 unified cache refill. This event counts for any cacheable read transaction returning data from the SCU for which the data source was outside the cluster. Transactions such as ReadUnique are counted here as 'read' transactions, even though they can be generated by store instructions. Prefetches and stashes that target the L3 cache are not counted.
0x2B	[70]	L3D_CACHE	Attributable L3 unified cache access. This event counts for any cacheable read transaction returning data from the SCU, or for any cacheable write to the SCU.
0x2D	[71]	L2TLB_REFILL	Attributable L2 unified TLB refill. This event counts on any refill of the L2 TLB, caused by either an instruction or data access. This event does not count if the MMU is disabled.
0x2F	[73:72]	L2TLB_REQ	Attributable L2 unified TLB access. This event counts on any access to the L2 TLB (caused by a refill of any of the L1 TLBs). This event does not count if the MMU is disabled.
0x31	[74]	REMOTE_ACCESS	Access to another socket in a multi-socket system
0x34	[75]	DTLB_WLK	Access to data TLB that caused a translation table walk. This event counts on any data access which causes L2D_TLB_REFILL to count.
0x35	[76]	ITLB_WLK	Access to instruction TLB that caused a translation table walk. This event counts on any instruction access which causes L2D_TLB_REFILL to count.
0x36	[79:77]	LL_CACHE_RD	Last level cache access, read. <ul style="list-style-type: none"> If CPUECTLR.EXTLLC is set: This event counts any cacheable read transaction which returns a data source of 'interconnect cache'. If CPUECTLR.EXTLLC is not set: This event is a duplicate of the L*D_CACHE_RD event corresponding to the last level of cache implemented – L3D_CACHE_RD if both per-core L2 and cluster L3 are implemented, L2D_CACHE_RD if only one is implemented, or L1D_CACHE_RD if neither is implemented.

Event number	PMU event bus (to trace)	Event mnemonic	Event description
0x37	[82:80]	LL_CACHE_MISS_RD	<p>Last level cache miss, read.</p> <ul style="list-style-type: none"> If CPUECTLR.EXTLLC is set: This event counts any cacheable read transaction which returns a data source of 'DRAM', 'remote' or 'inter-cluster peer'. If CPUECTLR.EXTLLC is not set: This event is a duplicate of the L*D_CACHE_REFILL_RD event corresponding to the last level of cache implemented – L3D_CACHE_REFILL_RD if both per-core L2 and cluster L3 are implemented, L2D_CACHE_REFILL_RD if only one is implemented, or L1D_CACHE_REFILL_RD if neither is implemented.
0x39	N/A	L1D_CACHE_LMISS_RD	L1 data cache long-latency miss
0x3A	N/A	OP_RETIRED	Micro-operation architecturally executed
0x3B	N/A	OP_SPEC	Micro-operation speculatively executed
0x3C	N/A	STALL	No operation sent for execution
0x3D	N/A	STALL_SLOT_BACKEND	No operation sent for execution on a slot due to the backend
0x3E	N/A	STALL_SLOT_FRONTEND	No operation sent for execution on a slot due to the frontend
0x3F	N/A	STALL_SLOT	No operation sent for execution on a slot
0x40	[84:83]	L1D_CACHE_RD	<p>L1 data cache access, read. This event counts any load operation or translation table walk access which looks up in the L1 data cache. In particular, any access which could count the L1D_CACHE_REFILL_RD event causes this event to count.</p> <p>The following instructions are not counted:</p> <ul style="list-style-type: none"> Cache maintenance instructions and prefetches Non-cacheable accesses
0x41	[86:85]	L1D_CACHE_WR	<p>L1 data cache access, write. This event counts any store operation which looks up in the L1 data cache. In particular, any access which could count the L1D_CACHE_REFILL_WR event causes this event to count.</p> <p>The following instructions are not counted:</p> <ul style="list-style-type: none"> Cache maintenance instructions and prefetches Non-cacheable accesses
0x42	[87]	L1D_CACHE_REFILL_RD	<p>L1 data cache refill, read. This event counts any load operation or translation table walk access which causes data to be read from outside the L1, including accesses which do not allocate into L1.</p> <p>The following instructions are not counted:</p> <ul style="list-style-type: none"> Cache maintenance instructions and prefetches Non-cacheable accesses

Event number	PMU event bus (to trace)	Event mnemonic	Event description
0x43	[88]	L1D_CACHE_REFILL_WR	<p>L1 data cache refill, write. This event counts any store operation which causes data to be read from outside the L1, including accesses which do not allocate into L1.</p> <p>The following instructions are not counted:</p> <ul style="list-style-type: none"> • Cache maintenance instructions and prefetches • Stores of an entire cache line, even if they make a coherency request outside the L1 • Partial cache line writes which do not allocate into the L1 cache • Non-cacheable accesses
0x44	[89]	L1D_CACHE_REFILL_INNER	L1 data cache refill, inner. This event counts any L1 data cache linefill (as counted by L1D_CACHE_REFILL) which hits in the L2 cache, L3 cache or another core in the cluster.
0x45	[90]	L1D_CACHE_REFILL_OUTER	L1 data cache refill, outer. This event counts any L1 data cache linefill (as counted by L1D_CACHE_REFILL) which does not hit in the L2 cache, L3 cache or another core in the cluster, and instead obtains data from outside the cluster.
0x46	[91]	L1D_CACHE_WB_VICTIM	L1 data cache write-back, victim
0x47	[92]	L1D_CACHE_WB_CLEAN	L1 data cache write-back cleaning and coherency
0x48	[93]	L1D_CACHE_INVALID	L1 data cache invalidate
0x4C	[94]	L1D_TLB_REFILL_RD	L1 data TLB refill, read
0x4D	[95]	L1D_TLB_REFILL_WR	L1 data TLB refill, write
0x4E	[97:96]	L1D_TLB_RD	L1 data TLB access, read
0x4F	[99:98]	L1D_TLB_WR	L1 data TLB access, write
0x50	[102:100]	CACHE_ACCESS_RD	<p>L2 unified cache access, read. This event counts any read transaction from L1 which looks up in the L2 cache.</p> <p>Snoops from outside the core are not counted.</p>
0x51	[105:103]	CACHE_ACCESS_WR	<p>L2 unified cache access, write. This event counts any write transaction from L1 which looks up in the L2 cache or any write-back from L1 which allocates into the L2 cache.</p> <p>Snoops from outside the core are not counted.</p>
0x52	[108:106]	CACHE_RD_REFILL	L2 unified cache refill, read. This event counts any cacheable read transaction from L1 which causes data to be read from outside the core. L2 refills caused by stashes into L2 should not be counted. Transactions such as ReadUnique are counted here as 'read' transactions, even though they can be generated by store instructions.
0x53	[111:109]	CACHE_WR_REFILL	L2 unified cache refill, write. This event counts any write transaction from L1 which causes data to be read from outside the core. L2 refills caused by stashes into L2 should not be counted. Transactions such as ReadUnique are not counted as write transactions.
0x56	[114:112]	CACHE_WRITEBACK_VICTIM	L2 unified cache write-back, victim
0x57	[117:115]	CACHE_WRITEBACK_CLEAN_COH	L2 unified cache write-back, cleaning and coherency
0x58	[120:118]	L2CACHE_INV	L2 unified cache invalidate
0x5C	[121]	L2TLB_RD_REFILL	L2 unified TLB refill, read

Event number	PMU event bus (to trace)	Event mnemonic	Event description
0x5D	[122]	L2TLB_WR_REFILL	L2 unified TLB refill, write

0x75	[167:163]	VFP_SPEC	Operation speculatively executed, floating-point instruction
0x76	[169:168]	PC_WRITE_SPEC	Operation speculatively executed, software change of the PC
0x77	[174:170]	CRYPTO_SPEC	Operation speculatively executed, Cryptographic instruction
0x78	[176:175]	BR_IMMED_SPEC	Branch speculatively executed, immediate branch
0x79	[178:177]	BR_RETURN_SPEC	Branch speculatively executed, procedure return
0x7A	[180:179]	BR_INDIRECT_SPEC	Branch speculatively executed, indirect branch

Event number	PMU event bus (to trace)	Event mnemonic	Event description
0x7C	[181]	ISB_SPEC	Barrier speculatively executed, ISB
0x7D	[183:182]	DSB_SPEC	Barrier speculatively executed, DSB
0x7E	[185:184]	DMB_SPEC	Barrier speculatively executed, DMB
0x81	[186]	EXC_UNDEF	Counts the number of undefined exceptions taken locally
0x82	[187]	EXC_SVC	Exception taken locally, Supervisor Call
0x83	[188]	EXC_PABORT	Exception taken locally, Instruction Abort
0x84	[189]	EXC_DABORT	Exception taken locally, Data Abort and SError
0x86	[190]	EXC_IRQ	Exception taken locally, IRQ
0x87	[191]	EXC_FIQ	Exception taken locally, FIQ
0x88	[192]	EXC_SMC	Exception taken locally, Secure Monitor Call
0x8A	[193]	EXC_HVC	Exception taken locally, Hypervisor Call
0x8B	[194]	EXC_TRAP_PABORT	Exception taken, Instruction Abort not taken locally
0x8C	[195]	EXC_TRAP_DABORT	Exception taken, Data Abort or SError not taken locally
0x8D	[196]	EXC_TRAP_OTHER	Exception taken, Other traps not taken locally
0x8E	[197]	EXC_TRAP_IRQ	Exception taken, IRQ not taken locally
0x8F	[198]	EXC_TRAP_FIQ	Exception taken, FIQ not taken locally
0x90	[203:199]	RC_LD_SPEC	Release consistency operation speculatively executed, load-acquire
0x91	[208:204]	RC_ST_SPEC	Release consistency operation speculatively executed, store-release
0xA0	[209]	L3D_CACHE_RD	L3 data cache read
0x4004	N/A	CNT_CYCLES	Constant frequency cycles
0x4005	N/A	STALL_BACKEND_MEM	No operation sent due to the backend and memory stalls
0x4006	N/A	L1I_CACHE_LMISS	L1 instruction cache long latency miss
0x4009	N/A	L2D_CACHE_LMISS_RD	L2 unified cache long latency miss
0x400B	N/A	L3D_CACHE_LMISS_RD	L3 unified cache long latency miss

4.2.4 PMU interrupts

The Cortex®-A78AE core asserts the nPMUIRQ signal when the *Performance Monitoring Unit* (PMU) generates an interrupt.

You can route this signal to an external interrupt controller for prioritization and masking. This is the only mechanism that signals this interrupt to the core.

This interrupt is also driven as a trigger input to the *Cross Trigger Interface* (CTI). For more information, see the *PMU interrupts* in the *Arm® DynamIQ™ Shared Unit AE Technical Reference Manual*.

4.2.5 Exporting PMU events

Some of the *Performance Monitoring Unit* (PMU) events are exported to the *Embedded Trace Macrocell* (ETM) trace unit to be monitored.

The PMUEVENT bus is not exported to external components. This is because the event bus cannot safely cross an asynchronous boundary when events can be generated on every cycle.

4.3 Activity Monitor Unit

This chapter describes the *Activity Monitor Unit* (AMU).

4.3.1 About the AMU

The Cortex®-A78AE core includes activity monitoring. It has features in common with performance monitoring, but is intended for system management use whereas performance monitoring is aimed at user and debug applications.

The activity monitors provide useful information for system power management and persistent monitoring. The activity monitors are read-only in operation and their configuration is limited to the highest Exception level implemented.

The Cortex®-A78AE core implements seven counters in two groups, each of which is a 64-bit counter counting a fixed event. Group 0 has 4 counters 0-3, and Group 1 has 3 counters 10-12. Activity monitoring is only implemented in AArch64.

The *Activity Monitor Unit* (AMU) operation is not affected by the debug authentication signals.

4.3.2 Accessing the activity monitors

The activity monitors can be accessed by:

- The System register interface for both AArch64 and AArch32 states
- Read-only memory-mapped access using the debug APB interface

4.3.2.1 Access enable bit

The access enable bit for traps on accesses to activity monitor registers is required at EL2 and EL3.

In the Cortex®-A78AE core, the TAM[30] bit in registers ACTLR_EL2 and ACTLR_EL3 controls the activity monitor registers enable.

4.3.2.2 System register access

The core implements activity monitoring in AArch64 and the activity monitors can be accessed using the `MRS` and `MSR` instructions.

4.3.2.3 External memory-mapped access

Activity monitors can also be memory-mapped accessed from the *Advanced Peripheral Bus* (APB) debug interface.

In this case, the *Activity Monitor Unit* (AMU) registers just provide debug information and are read-only.

4.3.3 AMU counters

The Cortex®-A78AE core implements four activity monitor counters, 00-03, and three auxiliary counters, 10-12. Each of the counters has the following characteristics:

- All events are counted in 64-bit wrapping counters that overflow when they wrap. There is no support for overflow status indication or interrupts.
- Any change in clock frequency, including when a *Wait For Interrupt* (WFI) and *Wait For Event* (WFE) instruction stops the clock, can affect any counter.
- Events 00-03 and auxiliary events 10-12 are fixed, and the `AMEVTYPER0<n>` and `AMEVTYPER1<n>` evtCount bits are read-only.
- The activity monitor counters are reset to zero on a Cold reset of the power domain of the core. When the core is not in reset, the *Activity Monitor Unit* (AMU) is available.

4.3.4 AMU events

The following table describes the counters that are implemented in the Cortex®-A78AE core and the mapping to events. All events are fixed.

Table 4-4: Mapping of counters to fixed events

Activity monitor counter <n>	Event	Event number	Description
AMEVCNTR00	CPU_CYCLES	0x0011	Core frequency cycles
AMEVCNTR01	CNT_CYCLES	0x4004	Constant frequency cycles
AMEVCNTR02	Instructions retired	0x0008	Instruction architecturally executed. This counter increments for every instruction that is executed architecturally, including instructions that fail their condition code check.
AMEVCNTR03	STALL_BACKEND_MEM	0x4005	Memory stall cycles. The counter counts cycles in which the core is unable to dispatch instructions from the frontend to the backend due to a backend stall caused by a miss in the last level of cache within the core clock domain.

Activity monitor counter <n>	Event	Event number	Description
AMEVCNTR10	Reserved	0x0300	Reserved
AMEVCNTR11	Reserved	0x0301	Reserved
AMEVCNTR12	Reserved	0x0302	Reserved

4.4 Embedded Trace Macrocell

This chapter describes the *Embedded Trace Macrocell* (ETM) for the Cortex®-A78AE core.

4.4.1 About the ETM

The *Embedded Trace Macrocell* (ETM) trace unit is a module that performs real-time instruction flow tracing based on the ETMv4 architecture. The ETM is a CoreSight component, and is an integral part of the Arm Real-time Debug solution, Arm Development Studio.

See the [Arm® Embedded Trace Macrocell Architecture Specification ETMv4](#) for more information.

4.4.2 ETM trace unit generation options and resources

The following table shows the trace generation options implemented in the Cortex®-A78AE *Embedded Trace Macrocell* (ETM) trace unit.

Table 4-5: ETM trace unit generation options implemented

Description	Configuration
Instruction address size in bytes	8
Data address size in bytes	0
Data value size in bytes	0
Virtual Machine ID size in bytes	4
Context ID size in bytes	4
Support for conditional instruction tracing	Not implemented
Support for tracing of data	Not implemented
Support for tracing of load and store instructions as PO elements	Not implemented
Support for cycle counting in the instruction trace	Implemented
Support for branch broadcast tracing	Implemented
Number of events supported in the trace	4
Return stack support	Implemented
Tracing of SError exception support	Implemented
Instruction trace cycle counting minimum threshold	4
Size of Trace ID	7 bits

Description	Configuration
Synchronization period support	Read/write
Global timestamp size	64 bits
Number of cores available for tracing	1
ATB trigger support	Implemented
Low-power behavior override	Not implemented
Stall control support	Implemented
Support for overflow avoidance	Not implemented
Support for using CONTEXTIDR_EL2 in VMID comparator	Implemented

The following table shows the resources implemented in the Cortex®-A78AE ETM trace unit.

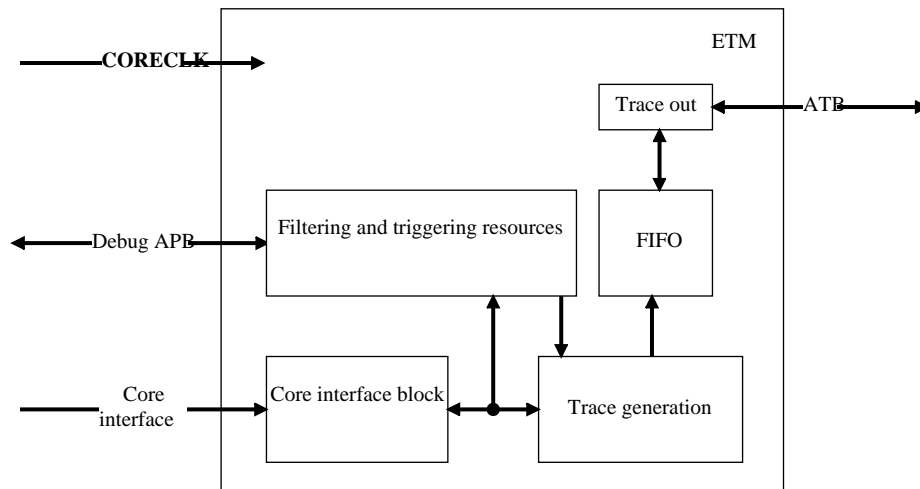

Table 4-6: ETM trace unit resources implemented

Description	Configuration
Number of resource selection pairs implemented	8
Number of external input selectors implemented	4
Number of external inputs implemented	214, 4 CTI + 210 PMU
Number of counters implemented	2
Reduced function counter implemented	Not implemented
Number of sequencer states implemented	4
Number of Virtual Machine ID comparators implemented	1
Number of Context ID comparators implemented	1
Number of address comparator pairs implemented	4
Number of single-shot comparator controls	1
Number of core comparator inputs implemented	0
Data address comparisons implemented	Not implemented
Number of data value comparators implemented	0

4.4.3 ETM trace unit functional description

This section describes the functionality of the *Embedded Trace Macrocell* (ETM) trace unit.

The following figure shows the main functional blocks of the ETM trace unit.

Figure 4-2: ETM functional blocks**Core interface**

This block monitors the behavior of the core and generates PO elements that are essentially executed branches and exceptions traced in program order.

Trace generation

The trace generation block generates various trace packets based on PO elements.

Filtering and triggering resources

You can limit the amount of trace data generated by the ETM through the process of filtering.

For example, generating trace only in a certain address range. More complicated logic analyzer style filtering options are also available.

The ETM trace unit can also generate a trigger that is a signal to the Trace Capture Device to stop capturing trace.

FIFO

The trace generated by the ETM trace unit is in a highly-compressed form.

The FIFO enables trace bursts to be flattened out. When the FIFO becomes full, the FIFO signals an overflow. The trace generation logic does not generate any new trace until the FIFO is emptied. This causes a gap in the trace when viewed in the debugger.

Trace out

Trace from FIFO is output on the *AMBA Trace Bus* (ATB) interface.

4.4.4 Resetting the ETM

The reset for the *Embedded Trace Macrocell* (ETM) trace unit is the same as a Cold reset for the core.

The ETM trace unit is not reset when Warm reset is applied to the core so that tracing through Warm reset is possible. However, if the core is reset using Warm reset, the last few instructions provided by the core before the reset might not be traced.

If the ETM trace unit is reset, tracing stops until the ETM trace unit is reprogrammed and re-enabled.

4.4.5 Programming and reading ETM trace unit registers

You program and read the *Embedded Trace Macrocell* (ETM) trace unit registers using the Debug APB interface.

The core does not have to be in Debug state when you program the ETM trace unit registers.

When you are programming the ETM trace unit registers, you must enable all the changes at the same time. Otherwise, if you program the counter, it might start to count based on incorrect events before the correct setup is in place for the trigger condition.

To disable the ETM trace unit, use the TRCPRGCTLR.EN bit.

Figure 4-3: Programming ETM trace unit registers

4.4.6 ETM trace unit register interfaces

The Cortex®-A78AE core supports only memory-mapped interface to trace registers.

See the [Arm® Embedded Trace Macrocell Architecture Specification ETMv4](#) for information on the behaviors on register accesses for different trace unit states and the different access mechanisms.

Related information

[External debug interface](#) on page 353

4.4.7 Interaction with the PMU and Debug

This section describes the interaction with the *Performance Monitoring Unit* (PMU) and the effect of debug double lock on trace register access.

Interaction with the PMU

The Cortex®-A78AE core includes a PMU that enables events, such as cache misses and instructions executed, to be counted over a period of time.

The PMU and *Embedded Trace Macrocell* (ETM) trace unit function together.

Use of PMU events by the ETM trace unit

The PMU architectural events described in [4.2.3 PMU events](#) on page 354 are available to the ETM trace unit through the extended input facility.

See the [Arm® Architecture Reference Manual for A-profile architecture](#) for more information about PMU events.

The ETM trace unit uses four extended external input selectors to access the PMU events. Each selector can independently select one of the PMU events, that are then active for the cycles where the relevant events occur. These selected events can then be accessed by any of the event registers within the ETM trace unit. The PMU event table describes the PMU events.

Related information

[PMU events](#) on page 354

4.5 Statistical Profiling Extension

This chapter describes the *Statistical Profiling Extension* (SPE) for the Cortex®-A78AE core.

4.5.1 About the statistical profiling extension

The Cortex®-A78AE core supports the *Statistical Profiling Extension* (SPE), which was introduced in Armv8.2 and further enhanced in Armv8.5. SPE provides a statistical view of the performance characteristics of executed instructions, which can be used by programmers to optimize their code for better performance.

This statistical view is provided by periodically capturing profiles of the characteristics of micro-operations as they are executed on the Cortex®-A78AE core, and writing those profiles to memory after the corresponding instruction has retired.

Profiling is always disabled at EL3. When profiling is disabled, no samples are collected and the sample counters are frozen.

4.5.2 SPE functional description

This section describes the functionality of the *Statistical Profiling Extension* (SPE).

At a high level, SPE behavior consists of:

- Selection of the micro-operation to be profiled
- Marking the selected micro-operation throughout its lifetime in the core, indicating within the various units that it is to be profiled
- Storing data about the profiled micro-operation in internal registers during its lifetime in the core
- Following retire/abort/flush of the profiled instruction, recording the profile data to memory

While the SPE architecture allows either instructions or micro-operations to be profiled, the core will profile micro-operations in order to minimize the amount of logic necessary to support SPE.

Profiles are collected periodically, with the selection of a micro-operation to be profiled being driven by a simple down-counter which counts the number of speculative micro-operations dispatched, decremented once for each micro-operation. When the counter reaches zero, a micro-operation is identified as being sampled and is profiled throughout its lifetime in the microarchitecture.

The profiling activity is expected to be largely non-intrusive to the core performance, meaning the core's performance should not be meaningfully perturbed while profiling is taking place. Permitted perturbation includes using LS/L2 bandwidth to record the profile data to memory.

The rate of occurrence of this activity depends on the sampling rate, which is user-specified, so it may be possible for the user to specify a sampling rate that is meaningfully intrusive to the core's performance.

- The core's recommended minimum sampling interval is once per 1024 uops.
- This value is also communicated to software via the PMSIDR_EL1 interval bits.

Unlike trace information, SPE profiles are written to memory using a *Virtual Address* (VA), which means that writes of profiles must have access to the MMU in order to translate a VA to a *Physical Address* (PA), and must have a means to be written to memory.

4.5.3 IMPLEMENTATION DEFINED features of SPE

This section describes the **IMPLEMENTATION DEFINED** features of *Statistical Profiling Extension* (SPE).

Events definition

The Cortex®-A78AE core includes a 32-bit event packet which is defined in the following table.

Table 4-7: 32-bit event packet

Bit	Definition
[31:13]	Reserved
12	Late prefetch
11	Data alignment flag
10	Remote access
9	Last level cache miss
8	Last level cache access
7	Branch mispredicted
6	Not taken
5	DTLB walk
4	TLB access
3	L1 data cache refill
2	L1 data cache access
1	Architecturally retired
0	Generated exception

Data source packet

The Cortex®-A78AE core provides an 8-bit data source for load and store operations as defined in the following table. All other values are reserved.

Table 4-8: 8-bit data source for load and store operations

Value	Name
0b0000	L1 data cache
0b1000	L2 cache
0b1001	Peer CPU
0b1010	Local cluster
0b1011	System cache
0b1100	Peer cluster
0b1101	Remote
0b1110	DRAM

5. Debug registers

This part describes the debug registers of the Cortex®-A78AE core.

5.1 AArch32 debug registers

This chapter describes the debug registers in the AArch32 Execution state and shows examples of how to use them.

5.1.1 AArch32 Debug register summary

The following table summarizes the 32-bit and 64-bit Debug control registers that are accessible in the AArch32 Execution state from the internal CP14 interface. These registers are accessed by the `MCR` and `MRC` instructions in the order of `CRn`, `op2`, `CRm`, `Op1` or `MCCR` and `MRRC` instructions in the order of `CRm`, `Op1`.

For those registers not described in this chapter, see the *Arm® Architecture Reference Manual Arm®v8*, for *Arm®v8-A architecture profile*.

Table 5-1: AArch32 Debug register summary

CRn	Op2	CRm	Op1	Name	Type	Reset	Description
c0	0	c1	0	DBGDSCRInt	RO	000x0000	Debug Status and Control Register, Internal View

c0	0	c5	0	DBGDTRRXint	RO	0x00000000	Debug Data Transfer Register, Receive, Internal View

5.2 AArch64 debug registers

This chapter describes the debug registers in the AArch64 Execution state and shows examples of how to use them.

5.2.1 AArch64 Debug register summary

This section summarizes the Debug control registers that are accessible in the AArch64 Execution state.

These registers, listed in the following table, are accessed by the `MRS` and `MSR` instructions in the order of `Op0`, `CRn`, `Op1`, `CRm`, `Op2`.

See [5.3.1 Memory-mapped Debug register summary](#) on page 381 for a complete list of registers accessible from the external debug interface. The 64-bit registers cover two addresses on the

external memory interface. For those registers not described in this chapter, see the [Arm® Architecture Reference Manual for A-profile architecture](#).

5.2.2 DBGBCRn_EL1, Debug Breakpoint Control Registers, EL1

The DBGBCRn_EL1 registers hold control information for a breakpoint. Each DBGBCRn_EL1 is associated with a DBGBCRn_EL1 to form a *Breakpoint Register Pair* (BRP). DBGBCRn_EL1 registers are associated with DBGBCRn_EL1 to form BRPn. The range of *n* for DBGBCRn_EL1 is 0 to 5.

Bit field descriptions

The DBGBCRn_EL1 registers are 32-bit registers.

Figure 5-1: DBGBCRn_EL1 bit assignments

RES0, [31:24]

RES0 Reserved

BT, [23:20]

Breakpoint Type. This field controls the behavior of Breakpoint debug event generation. This includes the meaning of the value held in the associated DBGBCRn_EL1, indicating whether it is an instruction address match or mismatch, or a Context match. It also controls whether the breakpoint is linked to another breakpoint. The possible values are:

0b0000	Unlinked instruction address match
0b0001	Linked instruction address match
0b0010	Unlinked Context ID match
0b0011	Linked Context ID match
0b0100	Unlinked instruction address mismatch
0b0101	Linked instruction address mismatch
0b0110	Unlinked CONTEXTIDR_EL1 match
0b0111	Linked CONTEXTIDR_EL1 match
0b1000	Unlinked VMID match
0b1001	Linked VMID match
0b1010	Unlinked VMID + Context ID match
0b1011	Linked VMID + Context ID match
0b1100	Unlinked CONTEXTIDR_EL2 match

0b1101	Linked CONTEXTIDR_EL2 match
0b1110	Unlinked Full Context ID match
0b1111	Linked Full Context ID match.

The field break down is:

- BT[3:1]: Base type. If the breakpoint is not context-aware, these bits are **RES0**. Otherwise, the possible values are:

0b000	Match address. DBGBVR _n _EL1 is the address of an instruction.
0b001	Match context ID. DBGBVR _n _EL1[31:0] is a context ID.
0b010	Match VMID. DBGBVR _n _EL1[47:32] is a VMID.
0b011	Match VMID and CONTEXTIDR_EL1. DBGBVR _n _EL1[31:0] is a context ID, and DBGBVR _n _EL1[47:32] is a VMID.

- BT[2]: Mismatch. **RES0**.
- BT[0]: Enable linking.

LBN, [19:16]

Linked breakpoint number. For Linked address matching breakpoints, this specifies the index of the Context-matching breakpoint linked to.

SSC, [15:14]

Security state control. Determines the Security states under which a Breakpoint debug event for breakpoint *n* is generated.

This field must be interpreted with the *Higher Mode Control* (HMC), and *Privileged Mode Control* (PMC), fields to determine the mode and Security states that can be tested.

See the [Arm® Architecture Reference Manual for A-profile architecture](#) for possible values of the HMC and PMC fields.

HMC, [13]

Hyp Mode Control bit. Determines the debug perspective for deciding when a breakpoint debug event for breakpoint *n* is generated.

This bit must be interpreted with the SSC and PMC fields to determine the mode and Security states that can be tested.

See the [Arm® Architecture Reference Manual for A-profile architecture](#) for possible values of the SSC and PMC fields.

RES0, [12:9]

RES0	Reserved
-------------	----------

BAS, [8:5]

Byte Address Select. Defines which halfwords a regular breakpoint matches, regardless of the instruction set and Execution state. A debugger must program this field as follows:

0x3	Match the T32 instruction at DBGBVRn_EL1
0xC	Match the T32 instruction at DBGBVRn_EL1+2
0xF	Match the A64 or A32 instruction at DBGBVRn_EL1, or context match

All other values are reserved.

The Arm®v8-A architecture does not support direct execution of Java bytecodes. BAS[3] and BAS[1] ignore writes and on reads return the values of BAS[2] and BAS[0] respectively.

See the [Arm® Architecture Reference Manual for A-profile architecture](#) for more information on how the BAS field is interpreted by hardware.

RES0, [4:3]

RES0	Reserved
-------------	----------

PMC, [2:1]

Privileged Mode Control. Determines the Exception level or levels that a breakpoint debug event for breakpoint *n* is generated.

This field must be interpreted with the SSC and HMC fields to determine the mode and Security states that can be tested.

See the [Arm® Architecture Reference Manual for A-profile architecture](#) for possible values of the SSC and HMC fields.

Bits[2:1] have no effect for accesses made in Hyp mode.

E, [0]

Enable breakpoint. This bit enables the BRP:

0	BRP disabled
1	BRP enabled

A BRP never generates a breakpoint debug event when it is disabled.

The value of DBGBCRn_EL1.E is **UNKNOWN** on reset. A debugger must ensure that DBGBCRn_EL1.E has a defined value before it enables debug.

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Architecture Reference Manual for A-profile architecture](#).

5.2.3 DBGCLAIMSET_EL1, Debug Claim Tag Set Register, EL1

The DBGCLAIMSET_EL1 is used by software to set CLAIM bits to 1.

Bit field descriptions

The DBGCLAIMSET_EL1 is a 32-bit register.

Figure 5-2: DBGCLAIMSET_EL1 bit assignments

RES0, [31:8]

RES0 Reserved

CLAIM, [7:0]

Claim set bits

Writing a 1 to one of these bits sets the corresponding CLAIM bit to 1. This is an indirect write to the CLAIM bits.

A single write operation can set multiple bits to 1. Writing 0 to one of these bits has no effect.

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Architecture Reference Manual for A-profile architecture](#).

5.2.4 DBGWCRn_EL1, Debug Watchpoint Control Registers, EL1

The DBGWCRn_EL1 holds control information for a watchpoint. Each DBGWCRn_EL1 is associated with a DBGWVRn_EL1 to form a *Watchpoint Register Pair* (WRP). DBGWCRn_EL1 is associated with DBGWVRn_EL1 to form WRPn. The range of *n* for DBGWCRn_EL1 is 0 to 3.

Bit field descriptions

The DBGWCRn_EL1 registers are 32-bit registers.

Figure 5-3: DBGWCRn_EL1 bit assignments**RES0, [31:29]**

RES0 Reserved

MASK, [28:24]

Address mask. Only objects up to 2GB can be watched using a single mask.

0b00000 No mask
0b00001 Reserved
0b00010 Reserved

Other values mask the corresponding number of address bits, from 0b00011 masking 3 address bits (0x00000007 mask for address) to 0b11111 masking 31 address bits (0x7FFFFFFF mask for address).

RES0, [23:21]

RES0 Reserved

WT, [20]

Watchpoint type. Possible values are:

0b0 Unlinked data address match
0b1 Linked data address match

On Cold reset, the field reset value is architecturally **UNKNOWN**.

LBN, [19:16]

Linked breakpoint number. For Linked data address watchpoints, this specifies the index of the Context-matching breakpoint linked to.

On Cold reset, the field reset value is architecturally **UNKNOWN**.

SSC, [15:14]

Security state control. Determines the Security states under which a watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the HMC and PAC fields.

On Cold reset, the field reset value is architecturally **UNKNOWN**.

HMC, [13]

Higher mode control. Determines the debug perspective for deciding when a watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and PAC fields.

On Cold reset, the field reset value is architecturally **UNKNOWN**.

BAS, [12:5]

Byte address select. Each bit of this field selects whether a byte from within the word or double-word addressed by DBGWVRn_EL1 is being watched. See the [Arm® Architecture Reference Manual for A-profile architecture](#) for more information.

LSC, [4:3]

Load/store access control. This field enables watchpoint matching on the type of access being made. The possible values are:

0b01	Match instructions that load from a watchpoint address
0b10	Match instructions that store to a watchpoint address
0b11	Match instructions that load from or store to a watchpoint address.

All other values are reserved, but must behave as if the watchpoint is disabled. Software must not rely on this property because the behavior of reserved values might change in a future revision of the architecture.

IGNORED if E is 0.

On Cold reset, the field reset value is architecturally **UNKNOWN**.

PAC, [2:1]

Privilege of access control. Determines the Exception level or levels at which a watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and HMC fields.

On Cold reset, the field reset value is architecturally **UNKNOWN**.

E, [0]

Enable watchpoint n. Possible values are:

0b0	Watchpoint disabled
0b1	Watchpoint enabled

On Cold reset, the field reset value is architecturally **UNKNOWN**.

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Architecture Reference Manual for A-profile architecture](#).

5.3 Memory-mapped debug registers

This chapter describes the memory-mapped debug registers and shows examples of how to use them.

5.3.1 Memory-mapped Debug register summary

The following table shows the offset address for the registers that are accessible from the external debug interface.

For those registers not described in this chapter, see the [Arm® Architecture Reference Manual for A-profile architecture](#).

Table 5-3: Memory-mapped Debug register summary

Offset	Name	Type	Width	Description
0x000–0x01C	-	-	-	Reserved

5.3.13 EDPIDRn, External Debug Peripheral Identification Registers 5-7

No information is held in the Peripheral ID5, Peripheral ID6, and Peripheral ID7 Registers.

They are reserved for future use and are **RES0**.

5.3.14 EDRCR, External Debug Reserve Control Register

The EDRCR is part of the Debug registers functional group. This register is used to allow imprecise entry to Debug state and clear sticky bits in EDSCR.

Bit field descriptions

Figure 5-15: EDRCR bit assignments

RES0, [31:4]

RES0 Reserved

CSPA, [3]

Clear Sticky Pipeline Advance. This bit is used to clear the EDSCR.PipeAdv bit to 0. The actions on writing to this bit are:

0	No action
1	Clear the EDSCR.PipeAdv bit to 0

CSE, [2]

Clear Sticky Error. Used to clear the EDSCR cumulative error bits to 0. The actions on writing to this bit are:

0	No action
1	Clear the EDSCR.{TXU, RXO, ERR} bits, and, if the core is in Debug state, the EDSCR.ITO bit, to 0

RES0, [1:0]

RES0 Reserved

The EDRCR can be accessed through the internal memory-mapped interface and the external debug interface, offset 0x090.

Usage constraints

This register is accessible as follows:

Off	DLK	OSLK	SLK	Default
Error	Error	Error	WI	WO

Configurations

EDRCR is in the Core power domain.

5.4 AArch32 PMU registers

This chapter describes the AArch32 *Performance Monitoring Unit* (PMU) registers and shows examples of how to use them.

5.4.1 AArch32 PMU register summary

The *Performance Monitoring Unit* (PMU) event counters and their associated control registers are accessible in the AArch32 Execution state from the internal CP15 System register interface with `MCR` and `MRC` instructions for 32-bit registers and `MCCR` and `MRRC` for 64-bit registers.

The following table gives a summary of the Cortex®-A78AE PMU registers in the AArch32 Execution state. For those registers not described in this chapter, see the [Arm® Architecture Reference Manual for A-profile architecture](#).

Table 5-5: PMU register summary in the AArch32 Execution state

5.4.2 PMCEID0, Performance Monitors Common Event Identification Register 0

The PMCEID0 defines which common architectural and common microarchitectural feature events are implemented.

Bit field descriptions

Figure 5-16: PMCEID0 bit assignments

ID[31:0], [31:0]

Common architectural and microarchitectural feature events that can be counted by the PMU event counters.

The following table shows the PMCEID0 bit assignments with event implemented or not implemented when the associated bit is set to 1 or 0. See the [Arm® Architecture Reference Manual for A-profile architecture](#) for more information about these events.

Table 5-6: PMU events

Bit	Event mnemonic	Description
[31]	L1D_CACHE_ALLOCATE	L1 Data cache allocate: 0 This event is not implemented.
[30]	CHAIN	Chain. For odd-numbered counters, counts once for each overflow of the preceding even-numbered counter. For even-numbered counters, does not count: 1 This event is implemented.
[29]	BUS_CYCLES	Bus cycle: 1 This event is implemented.
[28]	TTBR_WRITE_RETIRED	TTBR write, architecturally executed, condition check pass - write to translation table base: 1 This event is implemented.
[27]	INST_SPEC	Instruction speculatively executed: 1 This event is implemented.
[26]	MEMORY_ERROR	Local memory error: 1 This event is implemented.
[25]	BUS_ACCESS	Bus access: 1 This event is implemented.
[24]	L2D_CACHE_WB	L2 unified cache Write-Back: 1 This event is implemented.
[23]	L2D_CACHE_REFILL	L2 unified cache refill: 1 This event is implemented.
[22]	L2D_CACHE	L2 unified cache access: 1 This event is implemented.
[21]	L1D_CACHE_WB	L1 Data cache Write-Back: 1 This event is implemented.
[20]	L1I_CACHE	L1 Instruction cache access: 1 This event is implemented.
[19]	MEM_ACCESS	Data memory access: 1 This event is implemented.
[18]	BR_PRED	Predictable branch speculatively executed: 1 This event is implemented.
[17]	CPU_CYCLES	Cycle: 1 This event is implemented.

Bit	Event mnemonic	Description
[16]	BR_MIS_PRED	Mispredicted or not predicted branch speculatively executed: 1 This event is implemented.
[15]	UNALIGNED_LDST_RETIRED	Instruction architecturally executed, condition check pass - unaligned load or store: 0 This event is not implemented.
[14]	BR_RETURN_RETIRED	Instruction architecturally executed, condition check pass - procedure return: 0 This event is not implemented.
[13]	BR_IMMED_RETIRED	Instruction architecturally executed - immediate branch: 0 This event is not implemented.
[12]	PC_WRITE_RETIRED	Instruction architecturally executed, condition check pass - software change of the PC: 0 This event is not implemented.
[11]	CID_WRITE_RETIRED	Instruction architecturally executed, condition check pass - write to CONTEXTIDR: 1 This event is implemented.
[10]	EXC_RETURN	Instruction architecturally executed, condition check pass - exception return: 1 This event is implemented.
[9]	EXC_TAKEN	Exception taken: 1 This event is implemented.
[8]	INST_RETIRED	Instruction architecturally executed: 1 This event is implemented.
[7]	ST_RETIRED	Instruction architecturally executed, condition check pass - store: 0 This event is not implemented.
[6]	LD_RETIRED	Instruction architecturally executed, condition check pass - load: 0 This event is not implemented.
[5]	L1D_TLB_REFILL	L1 Data TLB refill: 1 This event is implemented.
[4]	L1D_CACHE	L1 Data cache access: 1 This event is implemented.
[3]	L1D_CACHE_REFILL	L1 Data cache refill: 1 This event is implemented.
[2]	L1I_TLB_REFILL	L1 Instruction TLB refill: 1 This event is implemented.

Bit	Event mnemonic	Description
[1]	L1I_CACHE_REFILL	L1 Instruction cache refill: 1 This event is implemented.
[0]	SW_INCR	Instruction architecturally executed, condition check pass - software increment: 1 This event is implemented.

The PMU events implemented in the above table can be found in [Table 4-3: PMU Events](#) on page 355.

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Architecture Reference Manual for A-profile architecture](#).

5.4.3 PMCEID1, Performance Monitors Common Event Identification Register 1

The PMCEID1 defines which common architectural and common microarchitectural feature events are implemented.

Bit field descriptions

Figure 5-17: PMCEID1 bit assignments

ID[31:0]

Common architectural and microarchitectural feature events that can be counted by the PMU event counters.

For each bit described in the following table, the event is implemented if the bit is set to 1, or not implemented if the bit is set to 0.

Table 5-7: PMU common events

Bit	Event mnemonic	Description
[31]	STALL_SLOT	No operation sent for execution on a slot. 1 This event is implemented.

Bit	Event mnemonic	Description
[30]	STALL_SLOT_FRONTEND	No operation sent for execution on a slot due to the frontend. 1 This event is implemented.
[29]	STALL_SLOT_BACKEND	No operation sent for execution on a slot due to the backend. 1 This event is implemented.
[28]	STALL	No operation sent for execution. 1 This event is implemented.
[27]	OP_SPEC	Micro-operation speculatively executed. 1 This event is implemented.
[26]	OP_RETIRED	Micro-operation architecturally executed. 1 This event is implemented.
[25]	L1D_CACHE_LMISS_RD	L1 data cache long-latency read miss. 1 This event is implemented.
[24]	REMOTE_ACCESS_RD	Attributable memory read access to another socket in a multi-socket system. 0 This event is not implemented.
[23]	LL_CACHE_MISS_RD	Attributable last level cache memory read miss. 1 This event is implemented.
[22]	LL_CACHE_RD	Attributable last level cache memory read. 1 This event is implemented.
[21]	ITLB_WALK	Attributable instruction TLB access with at least one translation table walk. 1 This event is implemented.
[20]	DTLB_WALK	Attributable data or unified TLB access with at least one translation table walk. 1 This event is implemented.
[19]	LL_CACHE_MISS	Attributable last level data or unified cache miss. 0 This event is not implemented.
[18]	LL_CACHE	Attributable last level data cache access. 0 This event is not implemented.
[17]	REMOTE_ACCESS	Attributable access to another socket in a multi-socket system. 1 This event is implemented.
[16]	L2I_TLB	Attributable L2 instruction TLB access. 0 This event is not implemented.

Bit	Event mnemonic	Description
[15]	L2D_TLB	Attributable L2 data or unified TLB access. 1 This event is implemented.
[14]	L2I_TLB_REFILL	Attributable L2 instruction TLB refill. 0 This event is not implemented.
[13]	L2D_TLB_REFILL	Attributable L2 data or unified TLB refill. 1 This event is implemented.
[12]	L3D_CACHE_WB	Attributable L3 data or unified TLB access. 0 This event is not implemented.
[11]	L3D_CACHE	Attributable L3 data cache access. 1 This event is implemented.
[10]	L3D_CACHE_REFILL	Attributable L3 data cache refill. 1 This event is implemented.
[9]	L3D_CACHE_ALLOCATE	Attributable L3 data or unified cache allocation without refill. 1 This event is implemented.
[8]	L2I_CACHE_REFILL	Attributable L2 unified cache refill. 0 This event is not implemented.
[7]	L2I_CACHE	Attributable L2 unified cache access. 0 This event is not implemented.
[6]	L1I_TLB	Attributable L1 instruction TLB access. 1 This event is implemented.
[5]	L1D_TLB	Attributable L1 data or unified TLB access. 1 This event is implemented.
[4]	STALL_BACKEND	No operation issued due to backend. 1 This event is implemented.
[3]	STALL_FRONTEND	No operation issued due to frontend. 1 This event is implemented.
[2]	BR_MIS_PRED_RETIRED	Instruction architecturally executed, mispredicted branch. 1 This event is implemented.
[1]	BR_RETIRED	Instruction architecturally executed, branch. 1 This event is implemented.

Bit	Event mnemonic	Description
[0]	L2D_CACHE_ALLOCATE	Attributable L2 unified cache allocation without refill. 1 This event is implemented.

5.4.4 PMCEID2, Performance Monitors Common Event Identification Register 2

The PMCEID2 defines which common architectural and common microarchitectural feature events are implemented.

Bit field descriptions

Figure 5-18: PMCEID2 bit assignments

RES0, [31:12]

RES0 Reserved

ID, [11:0]

Common architectural and microarchitectural feature events that can be counted by the PMU event counters.

For each bit described in the following table, the event is implemented if the bit is set to 1, or not implemented if the bit is set to 0.

Table 5-8: PMU common events

Bit	Event mnemonic	Description
[31:12]	RES0	Reserved
[11]	L3_CACHE_LMISS_RD	L3 unified cache long-latency read miss: 1 This event is implemented.
[10]	L2I_CACHE_LMISS	L2 unified cache long-latency miss: 0 This event is not implemented.
[9]	L2D_CACHE_LMISS_RD	L2 unified cache long-latency read miss: 1 This event is implemented.
[8]	RES0	Reserved

Bit	Event mnemonic	Description
[7]	RES0	Reserved
[6]	L1I_CACHE_LMISS	L1 instruction cache long-latency miss: 1 This event is implemented.
[5]	STALL_BACKEND_MEM	Memory stall cycles: 1 This event is implemented.
[4]	CNT_CYCLES	Constant frequency cycles: 1 This event is implemented.
[3]	SAMPLE_COLLISION	Sample collided with previous sample: 1 This event is implemented.
[2]	SAMPLE_FILTRATE	Sample taken and not removed by filtering: 1 This event is implemented.
[1]	SAMPLE_FEED	Sample taken: 1 This event is implemented.
[0]	SAMPLE_POP	Sample population: 1 This event is implemented.

5.4.5 PMCR, Performance Monitors Control Register

The PMCR provides details of the Performance Monitors implementation, including the number of counters implemented, and configures and controls the counters.

Bit field descriptions

PMCR is a 32-bit register, and is part of the Performance Monitors registers functional group.

Figure 5-19: PMCR bit assignments

IMP, [31:24]

Indicates the implementer code. The value is:

0x41 ASCII character 'A' - implementer is Arm® Limited.

IDCODE, [23:16]

Identification code. The value is:

0x22 Cortex®-A78AE core

N, [15:11]

Identifies the number of event counters implemented.

0b00110 The core implements six event counters.

RES0, [10:7]

RES0 Reserved

LC, [6]

Long cycle count enable. Determines which PMCCNTR bit generates an overflow recorded in PMOVSr[31]. The overflow event is generated on a 32-bit or 64-bit boundary. The possible values are:

0b0 Overflow event is generated on a 32-bit boundary, when an increment changes PMCCNTR[31] from 1 to 0. This is the reset value.

0b1 Overflow event is generated on a 64-bit boundary, when an increment changes PMCCNTR[63] from 1 to 0.

Arm deprecates use of PMCR.LC = 0b0.

DP, [5]

Disable cycle counter CCNT when event counting is prohibited. The possible values are:

0b0 Cycle counter operates regardless of the non-invasive debug authentication settings. This is the reset value.

0b1 Cycle counter is disabled if non-invasive debug is not permitted and enabled.

X, [4]

Export enable. This bit permits events to be exported to another debug device, such as a trace macrocell, over an event bus. The possible values are:

0b0 Export of events is disabled. This is the reset value.

0b1 Export of events is enabled.

No events are exported when counting is prohibited.

This field does not affect the generation of Performance Monitors overflow interrupt requests or signaling to a *Cross Trigger Interface* (CTI) that can be implemented as signals exported from the PE.

When this register has an architecturally defined reset value, if this field is implemented as an RW field, it resets to 0.

D, [3]

Clock divider. The possible values are:

- | | |
|------------|---|
| 0b0 | When enabled, counter CCNT counts every clock cycle. This is the reset value. |
| 0b1 | When enabled, counter CCNT counts once every 64 clock cycles. |

Arm deprecates use of PMCR.D = 0b1.

C, [2]

Cycle counter reset. This bit is WO. The effects of writing to this bit are:

- | | |
|------------|-------------------------------------|
| 0b0 | No action. This is the reset value. |
| 0b1 | Reset PMCCNTR to zero. |

This bit is always *Read-As-Zero* (RAZ).

Resetting PMCCNTR does not clear the PMCCNTR overflow bit to 0. See the [Arm® Architecture Reference Manual for A-profile architecture](#) for more information.

P, [1]

Event counter reset. This bit is WO. The effects of writing to this bit are:

- | | |
|------------|---|
| 0b0 | No action. This is the reset value. |
| 0b1 | Reset all event counters accessible in the current Exception level, not including PMCCNTR, to zero. |

This bit is always RAZ.

In Non-secure EL0 and EL1, a write of 1 to this bit does not reset event counters that HDCR.HPMN or MDCR_EL2.HPMN reserves for EL2 use.

In EL2 and EL3, a write of 1 to this bit resets all the event counters.

Resetting the event counters does not clear any overflow bits to 0.

E, [0]

Enable. The possible values are:

- | | |
|------------|---|
| 0b0 | All counters that are accessible at Non-secure EL1, including PMCCNTR, are disabled. This is the reset value. |
| 0b1 | When this register has an architecturally defined reset value, this field resets to 0. |

This bit is RW.

This bit does not affect the operation of event counters that HDCR.HPMN or MDCR_EL2.HPMN reserves for EL2 use.

When this register has an architecturally defined reset value, this field resets to 0.

Configurations

AArch32 System register PMCR is architecturally mapped to AArch64 System register PMCR_ELO. See [5.5.4 PMCR_ELO, Performance Monitors Control Register, ELO](#) on page 412.

AArch32 System register PMCR bits [6:0] are architecturally mapped to External register PMCR_ELO[6:0].

There is one instance of this register that is used in both Secure and Non-secure states.

This register is in the Warm reset domain. Some or all RW fields of this register have defined reset values. On a Warm or Cold reset these apply only if the PE resets into an Exception level that is using AArch32. Otherwise, on a Warm or Cold reset RW fields in this register reset to architecturally **UNKNOWN** values.

5.5 AArch64 PMU registers

This chapter describes the AArch64 *Performance Monitoring Unit* (PMU) registers and shows examples of how to use them.

5.5.1 AArch64 PMU register summary

The *Performance Monitoring Unit* (PMU) event counters and their associated control registers are accessible in the AArch64 Execution state with `MRS` and `MSR` instructions.

The following table gives a summary of the Cortex®-A78AE PMU registers in the AArch64 Execution state. For those registers not described in this chapter, see the [Arm® Architecture Reference Manual for A-profile architecture](#).

Table 5-9: PMU register summary in the AArch64 Execution state

[12]	L3D_CACHE_WB	Attributable L3 unified TLB access: 0 This event is not implemented.
[11]	L3D_CACHE	Attributable L3 unified cache access: 1 This event is implemented.
[10]	L3D_CACHE_REFILL	Attributable L3 unified cache refill: 1 This event is implemented.

Bit	Event mnemonic	Description
[9]	L3D_CACHE_ALLOCATE	Attributable L3 unified cache allocation without refill: 1 This event is implemented.
[8]	L2I_CACHE_REFILL	Attributable L2 unified cache refill: 0 This event is not implemented.
[7]	L2I_CACHE	Attributable L2 unified cache access: 0 This event is not implemented.
[6]	L1I_TLB	Attributable L1 instruction TLB access: 1 This event is implemented.
[5]	L1D_TLB	Attributable L1 data or unified TLB access: 1 This event is implemented.
[4]	STALL_BACKEND	No operation issued due to backend: 1 This event is implemented.
[3]	STALL_FRONTEND	No operation issued due to frontend: 1 This event is implemented.
[2]	BR_MIS_PRED_RETIRED	Instruction architecturally executed, mispredicted branch: 1 This event is implemented.
[1]	BR_RETIRED	Instruction architecturally executed, branch: 1 This event is implemented.
[0]	L2D_CACHE_ALLOCATE	Attributable L2 unified cache allocation without refill: 1 This event is implemented.

5.5.4 PMCR_ELO, Performance Monitors Control Register, ELO

The PMCR_ELO provides details of the Performance Monitors implementation, including the number of counters implemented, and configures and controls the counters.

Bit field descriptions

Figure 5-22: PMCR_ELO bit assignments

31	24	23	16	15	11	10	7	6	5	4	3	2	1	0		
IMP				IDCODE				N				L	C	D	P	E

RES0

IMP, [31:24]

Implementer code:

0x41 Arm

This is a read-only field.

IDCODE, [23:16]

Identification code:

0x22 Cortex®-A78AE

This is a read-only field.

N, [15:11]

Number of event counters

0b00110 Six counters**RES0, [10:7]****RES0** Reserved**LC, [6]**

Long cycle count enable. Determines which PMCCNTR_ELO bit generates an overflow recorded in PMOVSR[31]. The possible values are:

0	Overflow on increment that changes PMCCNTR_ELO[31] from 1 to 0
1	Overflow on increment that changes PMCCNTR_ELO[63] from 1 to 0

DP, [5]

Disable cycle counter, PMCCNTR_ELO when event counting is prohibited:

0	Cycle counter operates regardless of the non-invasive debug authentication settings. This is the reset value.
1	Cycle counter is disabled if non-invasive debug is not permitted and enabled.

This bit is read/write.

X, [4]

Export enable. This bit permits events to be exported to another debug device, such as a trace macrocell, over an event bus:

0	Export of events is disabled. This is the reset value.
1	Export of events is enabled.

This bit is read/write and does not affect the generation of Performance Monitors interrupts on the nPMUIRQ pin.

D, [3]

Clock divider:

- | | |
|----------|--|
| 0 | When enabled, PMCCNTR_ELO counts every clock cycle. This is the reset value. |
| 1 | When enabled, PMCCNTR_ELO counts every 64 clock cycles. |

This bit is read/write.

C, [2]

Clock counter reset. This bit is WO. The effects of writing to this bit are:

- | | |
|----------|-------------------------------------|
| 0 | No action. This is the reset value. |
| 1 | Reset PMCCNTR_ELO to 0. |

This bit is always RAZ.

Resetting PMCCNTR_ELO does not clear the PMCCNTR_ELO overflow bit to 0. See the [Arm® Architecture Reference Manual for A-profile architecture](#) for more information.

P, [1]

Event counter reset. This bit is WO. The effects of writing to this bit are:

- | | |
|----------|---|
| 0 | No action. This is the reset value. |
| 1 | Reset all event counters, not including PMCCNTR_ELO, to zero. |

This bit is always RAZ.

In Non-secure EL0 and EL1, a write of 1 to this bit does not reset event counters that MDCR_EL2.HPMN reserves for EL2 use.

In EL2 and EL3, a write of 1 to this bit resets all the event counters.

Resetting the event counters does not clear any overflow bits to 0.

E, [0]

Enable. The possible values of this bit are:

- | | |
|----------|---|
| 0 | All counters, including PMCCNTR_ELO, are disabled. This is the reset value. |
| 1 | All counters are enabled. |

This bit is RW.

In Non-secure EL0 and EL1, this bit does not affect the operation of event counters that MDCR_EL2.HPMN reserves for EL2 use.

On Warm reset, the field resets to 0.

Configurations

AArch64 System register PMCR_ELO is architecturally mapped to AArch32 System register PMCR.

Bit fields and details that are not provided in this description are architecturally defined. See the [Arm® Architecture Reference Manual for A-profile architecture](#).

5.5.5 CPUPMMIR_EL1, Performance Monitors Machine Identification Register, EL1

The CPUPMMIR_EL1 is a 64-bit register that describes performance monitors parameters specific to the implementation to software.

Bit field descriptions

Figure 5-23: CPUPMMIR_EL1 bit assignments

RES0, [63:8]

RES0 Reserved

SLOTS, [7:0]

0x06 Operation width. The largest value by which the STALL_SLOT event might increment by in a single cycle.

Usage constraints

Accessing the CPUPMMIR_EL1

This register can be read with the MRS instruction using the following syntax:

```
MRS <Xt>, <systemreg>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
CPUPMMIR_EL1	3	15	0	6	14

5.6 Memory-mapped PMU registers

This chapter describes the memory-mapped *Performance Monitoring Unit* (PMU) registers and shows examples of how to use them.

5.6.1 Memory-mapped PMU register summary

There are *Performance Monitoring Unit* (PMU) registers that are accessible through the external debug interface.

These registers are listed in the following table. For those registers not described in this chapter, see the [Arm® Architecture Reference Manual for A-profile architecture](#).

Table 5-13: Memory-mapped PMU register summary

5.6.13 PMPIDRn, Performance Monitors Peripheral Identification Register 5-7

No information is held in the Peripheral ID5, Peripheral ID6, and Peripheral ID7 Registers.

They are reserved for future use and are **RES0**.

5.7 PMU snapshot registers

Performance Monitoring Unit (PMU) snapshot registers are an **IMPLEMENTATION DEFINED** extension to an Arm®v8-A compliant PMU to support an external core monitor that connects to a system profiler.

5.7.1 PMU snapshot register summary

The snapshot registers are visible in an **IMPLEMENTATION DEFINED** region of the *Performance Monitoring Unit* (PMU) external debug interface. Each time the debugger sends a snapshot request, information is collected to see how the code is executed in the different cores.

The following table describes the PMU snapshot registers implemented in the core.

Table 5-14: PMU snapshot register summary

Offset	Name	Type	Width	Description
0x600	PMPCSSR_LO	RO	32	5.7.2 PMPCSSR, PMU Snapshot Program Counter Sample Register on page 428
0x604	PMPCSSR_HI	RO	32	
0x608	PMCIDSSR	RO	32	5.7.3 PMCIDSSR, PMU Snapshot CONTEXTIDR_EL1 Sample Register on page 429
0x60C	PMCID2SSR	RO	32	5.7.4 PMCID2SSR, PMU Snapshot CONTEXTIDR_EL2 Sample Register on page 429

0x6F0	PMSSCR	WO	32	5.7.9 PMSSCR, PMU Snapshot Capture Register on page 432

5.7.2 PMPCSSR, PMU Snapshot Program Counter Sample Register

The PMPCSSR holds the same value as the PMPCSR register.

However, unlike the other view of PMPCSR, it is not sensitive to reads. That is, reads of PMPCSSR through the PMU snapshot view do not cause a new sample capture and do not change PMCID1SR, PMCID2SR, or PMVIDSR.

Bit field descriptions

The PMPCSSR is a 64-bit read-only register.

Figure 5-35: PMPCSSR bit assignments

PC, [55:0]

Sampled PC

Configurations

There are no configuration notes.

Usage constraints

Any access to PMPCSSR returns an error if any of the following occurs:

- The Core power domain is off.
- DoubleLockStatus() == TRUE.

5.7.3 PMCIDSSR, PMU Snapshot CONTEXTIDR_EL1 Sample Register

The PMCIDSSR holds the same value as the PMCID1SR register.

Configurations

There are no configuration notes.

Usage constraints

Any access to PMCIDSSR returns an error if any of the following occurs:

- The Core power domain is off.
- DoubleLockStatus() == TRUE.

5.7.4 PMCID2SSR, PMU Snapshot CONTEXTIDR_EL2 Sample Register

The PMCID2SSR holds the same value as the PMCID2SR register.

Configurations

There are no configuration notes.

Usage constraints

Any access to PMCID2SSR returns an error if any of the following occurs:

- The Core power domain is off.
- DoubleLockStatus() == TRUE.

5.7.5 PMSSSR, PMU Snapshot Status Register

The PMSSSR holds status information about the captured counters.

Bit field descriptions

The PMSSSR is a 32-bit read-only register.

Figure 5-36: PMSSSR bit assignments

RES0, [31:1]

RES0 Reserved

NC, [0]

No capture. This bit indicates whether the PMU event counters have been captured. The possible values are:

0	PMU event counters are captured.
1	PMU event counters are not captured.

If there is a security violation, the core does not capture the event counters. The external monitor is responsible for keeping track of whether it managed to capture the snapshot registers from the core.

This bit does not reflect the status of the captured Program Counter Sample registers.

The core resets this bit to 1 by a Warm reset but MPSSSR.NC is overwritten at the first capture.

Configurations

There are no configuration notes.

Usage constraints

Any access to PMSSSR returns an error if any of the following occurs:

- The Core power domain is off.
- DoubleLockStatus() == TRUE.

5.7.6 PMOVSSR, PMU Snapshot Overflow Status Register

The PMOVSSR is a captured copy of PMOVSR.

Once it is captured, the value in PMOVSSR is unaffected by writes to PMOVSET_ELO and PMOVCLR_ELO.

Configurations

There are no configuration notes.

Usage constraints

Any access to PMOVSSR returns an error if any of the following occurs:

- The Core power domain is off.
- DoubleLockStatus() == TRUE.

5.7.7 PMCCNTSR, PMU Snapshot Cycle Counter Register

The PMCCNTSR is a captured copy of PMCCNTR_ELO.

Once it is captured, the value in PMCCNTSR is unaffected by writes to PMCCNTR_ELO and PMCR_ELO.C.

Configurations

There are no configuration notes.

Usage constraints

Any access to PMCCNTSR returns an error if any of the following occurs:

- The Core power domain is off.
- DoubleLockStatus() == TRUE.

5.7.8 PMEVCNTRn, PMU Event Counter Snapshot Cycle Registers 0-5

The PMEVCNTRn registers are captured copies of PMEVCNTRn_ELO registers. The range of *n* for PMEVCNTRn is 0 to 5.

When they are captured, the value in PMEVCNTRn is unaffected by writes to PMEVCNTRn_ELO and PMCR_ELO.P.

Configurations

There are no configuration notes.

Usage constraints

Any access to PMEVCNTRn registers returns an error if any of the following occurs:

- The Core power domain is off.
- DoubleLockStatus() == TRUE.

5.7.9 PMSSCR, PMU Snapshot Capture Register

The PMSSCR provides a mechanism for software to initiate a sample.

Bit field descriptions

The PMSSCR is a 32-bit write-only register.

Figure 5-37: PMSSCR bit assignments

RES0, [31:1]

RES0	Reserved
------	----------

SS, [0]

Capture now. The possible values are:

0	IGNORED
1	Initiate a capture immediately

Configurations

There are no configuration notes.

Usage constraints

Any access to PMSSCR returns an error if any of the following occurs:

- The Core power domain is off.
- DoubleLockStatus() == TRUE.

5.8 AArch64 AMU registers

This chapter describes the AArch64 *Activity Monitor Unit* (AMU) registers and shows examples of how to use them.

5.8.1 AArch64 AMU register summary

The following table gives a summary of the Cortex®-A78AE *Activity Monitor Unit* (AMU) registers in the AArch64 Execution state.

Table 5-15: AArch64 AMU registers

Name	Width	Reset	Description
AMUSERENR_ELO	32	0x00000000	5.8.13 AMUSERENR_ELO, Activity Monitors User Enable Register, ELO on page 452

5.8.2 AMCFGR_ELO, Activity Monitors Configuration Register, ELO

AMCFGR_ELO provides information on the number of activity counters implemented and their size.

Bit field descriptions

AMCFGR_ELO is a 32-bit register.

Figure 5-38: AMCFGR_ELO bit assignments

NCG, [31:28]

Number of counter groups

The number of counter groups implemented is NCG+1. If the number of auxiliary counters implemented is zero, this field is 0x1.

RES0, [27:25]

RES0 Reserved

HDBG, [24]

Halt-on-debug feature support

This field is required, therefore the value of this field is 0b1.

RAZ, [23:14]

Read-As-Zero

SIZE, [13:8]

Size of counters, minus one

This field defines the size of the largest counter implemented by the activity monitors. In the Armv8-A architecture, the largest counter has 64 bits, therefore the value of this field is 0b111111.

N, [7:0]

Number of activity counters implemented, where the number of counters is N+1. The Cortex®-A78AE core implements four counters, therefore the value is 0x06.

Configurations

There are no configuration notes.

Usage constraints

Accessing AMCFGR_EL0

To access AMCFGR_EL0:

```
MRS <Xt>, AMCFGR_EL0 ; Read AMCFGR_EL0 into Xt
```

Register access is encoded as follows:

Table 5-16: AMCFGR_EL0 encoding

op0	op1	CRn	CRm	op2
3	3	c15	c2	1

AMCFGR_EL0 can be accessed through the external debug interface, offset 0xE00. In this case, it is read-only.

This register is accessible as follows:

EL0	EL1	EL2	EL3
RO	RO	RO	RO

Traps and enables

The following control bits for traps on accesses to activity monitor registers are introduced:

- The ACTLR_EL3.TAM (trap activity monitor access) bit traps EL2, EL1 and EL0 accesses to all activity monitor registers to EL3, from both Security states.

0b0	EL2, EL1 and EL0 accesses to all activity monitor registers are not trapped to EL3.
0b1	EL2, EL1 and EL0 accesses to all activity monitor registers are trapped to EL3.
- The ACTLR_EL2.TAM (trap activity monitor access) bit traps Non-secure EL1 and EL0 accesses to all activity monitor registers to EL2.

0b0	Non-secure accesses from EL1 and EL0 to activity monitor registers are not trapped to EL2.
0b1	Non-secure accesses from EL1 and EL0 to activity monitor registers are trapped to EL2.

The TAM bit is allocated to bit [30] of ACTLR_EL3 and ACTLR_EL2.

The previously defined ACTLR_ELx.AMEN bits are now **RES0**.

5.8.3 AMCGCR_EL0, Activity Monitors Counter Group Configuration Register, EL0

AMCGCR_EL0 provides information on the number of activity counters implemented within each group.

Bit field descriptions

AMCGCR_EL0 is a 32-bit register.

Figure 5-39: AMCGCR_EL0 bit assignments

RES0, [31:16]

RES0 Reserved

CG1NC, [15:8]

The number of counters in the auxiliary counter group. A value of 0b0001 is equal to one counter. For AMUv1, the permitted range is 0 to 16. The Cortex®-A78AE core implements three auxiliary counters so the value is 0x3.

CG0NC, [7:0]

The number of counters in the architected counter group. A value of 0b0001 is equal to one counter. For AMUv1, this value is 4.

Configurations

There are no configuration notes.

Usage constraints

Accessing AMCGCR_EL0

To access AMCGCR_EL0:

```
MRS <Xt>, AMCGCR_EL0 ; Read AMCGCR_EL0 into Xt
```

Register access is encoded as follows:

Table 5-18: AMCGCR_EL0 encoding

op0	op1	CRn	CRm	op2
3	3	c15	c2	2

AMCGCR_ELO can be accessed through the external debug interface, offset 0xCE0. In this case, it is read-only.

This register is accessible as follows:

EL0	EL1	EL2	EL3
RO	RO	RO	RO

Traps and enables

The following control bits for traps on accesses to activity monitor registers are introduced:

- The ACTLR_EL3.TAM (trap activity monitor access) bit traps EL2, EL1 and EL0 accesses to all activity monitor registers to EL3, from both Security states.

0b0 EL2, EL1 and EL0 accesses to all activity monitor registers are not trapped to EL3.

Ob1 EL2, EL1 and ELO accesses to all activity monitor registers are trapped to EL3.

- The ACTLR_EL2.TAM (trap activity monitor access) bit traps Non-secure EL1 and EL0 accesses to all activity monitor registers to EL2.

0b0 Non-secure accesses from EL1 and EL0 to activity monitor registers are not trapped to EL2.

0b1 Non-secure accesses from EL1 and ELO to activity monitor registers are trapped to EL2.

The TAM bit is allocated to bit [30] of ACTLR_EL3 and ACTLR_EL2.

The previously defined ACTLR_ELx.AMEN bits are now **RES0**.

5.8.4 AMCNTENCLR0_ELO, Activity Monitors Count Enable Clear Register 0, ELO

AMCNTENCLR0 ELO disables the activity monitor counters implemented, AMEVCNTR<0-3> ELO.

Bit field descriptions

AMCNTENCLR0_ELO is a 32-bit register.

Figure 5-40: AMCNTENCLR0_ELO bit assignments

RAZ/WI, [31:4]

Read-As-Zero, Writes Ignored

P<n>, [3:0]

AMEVCNTR0n_ELO disable bit. The possible values are:

- | | |
|----------|---|
| 0 | When this bit is read, the activity counter n is disabled. When it is written, it has no effect. |
| 1 | When this bit is read, the activity counter n is enabled. When it is written, it disables the activity counter n. |

Configurations

There are no configuration notes.

Usage constraints**Accessing AMCNTECLR0_ELO**

To access AMCNTECLR0_ELO:

MRS <Xt>, AMCNTECLR0_ELO ; Read AMCNTECLR0_ELO into Xt

Register access is encoded as follows:

Table 5-20: AMCNTECLR0_ELO encoding

op0	op1	CRn	CRm	op2
3	3	c15	c2	4

AMCNTECLR0_ELO can be accessed through the external debug interface, offset 0xC20. In this case, it is read-only.

This register is accessible as follows:

ELO	EL1	EL2	EL3
RO	RO	RO	RO

Traps and enables

The following control bits for traps on accesses to activity monitor registers are introduced:

- The ACTLR_EL3.TAM (trap activity monitor access) bit traps EL2, EL1 and ELO accesses to all activity monitor registers to EL3, from both Security states.

0b0 EL2, EL1 and ELO accesses to all activity monitor registers are not trapped to EL3.

0b1 EL2, EL1 and ELO accesses to all activity monitor registers are trapped to EL3.

- The ACTLR_EL2.TAM (trap activity monitor access) bit traps Non-secure EL1 and ELO accesses to all activity monitor registers to EL2.

Register access is encoded as follows:

Table 5-22: AMCNTENCLR1_ELO encoding

op0	op1	CRn	CRm	op2
3	3	c15	c3	0

AMCNTENCLR1_ELO can be accessed through the external debug interface, offset 0xC24. In this case, it is read-only.

This register is accessible as follows:

EL0	EL1	EL2	EL3
RO	RO	RO	RO

Traps and enables

The following control bits for traps on accesses to activity monitor registers are introduced:

- The ACTLR_EL3.TAM (trap activity monitor access) bit traps EL2, EL1 and EL0 accesses to all activity monitor registers to EL3, from both Security states.

0b0 EL2, EL1 and EL0 accesses to all activity monitor registers are not trapped to EL3.

0b1 EL2, EL1 and EL0 accesses to all activity monitor registers are trapped to EL3.

- The ACTLR_EL2.TAM (trap activity monitor access) bit traps Non-secure EL1 and EL0 accesses to all activity monitor registers to EL2.

0b0 Non-secure accesses from EL1 and EL0 to activity monitor registers are not trapped to EL2.

0b1 Non-secure accesses from EL1 and EL0 to activity monitor registers are trapped to EL2.

The TAM bit is allocated to bit [30] of ACTLR_EL3 and ACTLR_EL2.

The previously defined ACTLR_ELx.AMEN bits are now **RES0**.

5.8.6 AMCNTENSET0_ELO, Activity Monitors Count Enable Set Register 0, EL0

AMCNTENSET0_ELO enables the activity monitor counters implemented, AMEVCNTR0<0-3>_ELO.

Bit field descriptions

AMCNTENSET0_ELO is a 32-bit register.

Figure 5-42: AMCNTENSET0_ELO bit assignments

RAZ/WI, [31:4]

Read-As-Zero, Writes Ignored

$P\langle n \rangle, [3:0]$

AMEVCNTR0<0-3> ELO enable bit. The possible values are:

0	When this bit is read, the activity counter n is disabled. When it is written, it has no effect.
1	When this bit is read, the activity counter n is enabled. When it is written, it enables the activity counter n.

Configurations

There are no configuration notes.

Usage constraints

Accessing AMCNTENSET0_ELO

To access `AMCNTENSET0` ELO:

```
MRS <Xt>, AMCNTENSET0 ELO ; Read AMCNTENSET0 ELO into Xt
```

Register access is encoded as follows:

Table 5-24: AMCNTENSET0_ELO encoding

op0	op1	CRn	CRm	op2
3	3	c15	c2	5

AMCNTENSET0_ELO can be accessed through the external debug interface, offset 0xC00. In this case, it is read-only.

This register is accessible as follows:

EL0	EL1	EL2	EL3
RO	RO	RO	RO

Traps and enables

The following control bits for traps on accesses to activity monitor registers are introduced:

- The ACTLR_EL3.TAM (trap activity monitor access) bit traps EL2, EL1 and EL0 accesses to all activity monitor registers to EL3, from both Security states.

0b0	EL2, EL1 and EL0 accesses to all activity monitor registers are not trapped to EL3.
0b1	EL2, EL1 and EL0 accesses to all activity monitor registers are trapped to EL3.

- The ACTLR_EL2.TAM (trap activity monitor access) bit traps Non-secure EL1 and EL0 accesses to all activity monitor registers to EL2.

0b0	Non-secure accesses from EL1 and EL0 to activity monitor registers are not trapped to EL2.
0b1	Non-secure accesses from EL1 and EL0 to activity monitor registers are trapped to EL2.

The TAM bit is allocated to bit [30] of ACTLR EL3 and ACTLR EL2.

The previously defined ACTLR ELx.AMEN bits are now **RES0**.

5.8.7 AMCNTENSET1_ELO, Activity Monitors Count Enable Set Register 1, ELO

AMCNTENSET1_ELO enables the control bits for the auxiliary activity monitor counters, AMEVCNTR1<0-2> ELO.

Bit field descriptions

AMCNTENSET1_ELO is a 32-bit register.

Figure 5-43: AMCNTENSET1_ELO bit assignments

RAZ/WI, [31:3]

Read-As-Zero, Writes Ignored

 $P\langle n \rangle, [2:0]$

AMEVCNTR1<0-2> ELO enable bit. The possible values are:

0	When this bit is read, the activity counter n is disabled. When it is written, it has no effect.
1	When this bit is read, the activity counter n is enabled. When it is written, it enables the activity counter n.

Configurations

There are no configuration notes.

Usage constraints

Accessing AMCNTESET1_ELO

To access AMCNTESET1_ELO:

```
MRS <Xt>, AMCNTESET1_ELO ; Read AMCNTESET1_ELO into Xt
```

Register access is encoded as follows:

Table 5-26: AMCNTESET1_ELO encoding

op0	op1	CRn	CRm	op2
3	3	c15	c3	1

AMCNTESET1_ELO can be accessed through the external debug interface, offset 0xC04. In this case, it is read-only.

This register is accessible as follows:

ELO	EL1	EL2	EL3
RO	RO	RO	RO

Traps and enables

The following control bits for traps on accesses to activity monitor registers are introduced:

- The ACTLR_EL3.TAM (trap activity monitor access) bit traps EL2, EL1 and ELO accesses to all activity monitor registers to EL3, from both Security states.

0b0 EL2, EL1 and ELO accesses to all activity monitor registers are not trapped to EL3.

0b1 EL2, EL1 and ELO accesses to all activity monitor registers are trapped to EL3.

- The ACTLR_EL2.TAM (trap activity monitor access) bit traps Non-secure EL1 and ELO accesses to all activity monitor registers to EL2.

0b0 Non-secure accesses from EL1 and ELO to activity monitor registers are not trapped to EL2.

0b1 Non-secure accesses from EL1 and ELO to activity monitor registers are trapped to EL2.

The TAM bit is allocated to bit [30] of ACTLR_EL3 and ACTLR_EL2.

The previously defined ACTLR_ELx.AMEN bits are now **RES0**.

5.8.8 AMCR_ELO, Activity Monitors Control Register, ELO

AMCR_ELO is the global control register for the activity monitors.

Bit field descriptions

AMCR_ELO is a 32-bit register.

Figure 5-44: AMCR_ELO bit assignments

RES0, [31:11]

RES0 Reserved

HDBG, [10]

This bit controls whether activity monitor counting is halted when the core is halted in Debug state.

- | | |
|------------|---|
| 0b0 | Activity Monitors do not stop counting when the core is stopped in Debug state. |
| 0b1 | Activity Monitors stop counting when the core is stopped in Debug state. |

RAZ/WI, [9:0]

Read-As-Zero, Writes Ignored

Configurations

There are no configuration notes.

Usage constraints

Accessing AMCR_ELO

To access AMCR_ELO:

```
MRS <Xt>, AMCR_ELO ; Read AMCR_ELO into Xt
```

Register access is encoded as follows:

Table 5-28: AMCR_ELO encoding

op0	op1	CRn	CRm	op2
3	3	c15	c2	0

AMCR_ELO can be accessed through the external debug interface, offset 0xE04. In this case, it is read-only.

This register is accessible as follows:

ELO	EL1	EL2	EL3
RO	RO	RO	RO

Traps and enables

The following control bits for traps on accesses to activity monitor registers are introduced:

- The ACTLR_EL3.TAM (trap activity monitor access) bit traps EL2, EL1 and ELO accesses to all activity monitor registers to EL3, from both Security states.

0b0 EL2, EL1 and ELO accesses to all activity monitor registers are not trapped to EL3.

0b1 EL2, EL1 and ELO accesses to all activity monitor registers are trapped to EL3.

- The ACTLR_EL2.TAM (trap activity monitor access) bit traps Non-secure EL1 and ELO accesses to all activity monitor registers to EL2.

0b0 Non-secure accesses from EL1 and ELO to activity monitor registers are not trapped to EL2.

0b1 Non-secure accesses from EL1 and ELO to activity monitor registers are trapped to EL2.

The TAM bit is allocated to bit [30] of ACTLR_EL3 and ACTLR_EL2.

The previously defined ACTLR_ELx.AMEN bits are now **RES0**.

5.8.9 AMEVCNTR0n_ELO, Activity Monitors Event Counter Registers 0n, ELO

The AMEVCNTR0n_ELO registers provide access to the architected, required activity monitor event counters.

Bit field descriptions

The AMEVCNTR0n_ELO registers are 64-bit registers.

Figure 5-45: AMEVCNTR0n_ELO bit assignments**ACNT, [63:0]**

Value of the activity counter AMEVCNTR0n_ELO.

This bit field resets to zero and the counters monitoring cycle events do not increment when the core is in *Wait For Interrupt* (WFI) or *Wait For Event* (WFE).

Configurations

There are no configuration notes.

Usage constraints**Accessing AMEVCNTR0n_ELO**

To access AMEVCNTR0n_ELO:

```
MRS <Xt>, AMEVCNTR0n_ELO ; Read AMEVCNTR0n_ELO into Xt
```

Register access is encoded as follows:

Table 5-30: AMEVCNTR0n_ELO encoding

op0	op1	CRn	CRm	op2
3	3	c15	c4	<n>

AMEVCNTR0n_ELO[63:32] can also be accessed through the external memory-mapped interface, offset $0x004+8n$. In this case, it is read-only.

AMEVCNTR0n_ELO[31:0] can also be accessed through the external memory-mapped interface, offset $0x000+8n$. In this case, it is read-only.

This register is accessible as follows:

ELO	EL1	EL2	EL3
RO	RO	RO	RO

Traps and enables

The following control bits for traps on accesses to activity monitor registers are introduced:

- The ACTLR_EL3.TAM (trap activity monitor access) bit traps EL2, EL1 and ELO accesses to all activity monitor registers to EL3, from both Security states.

0b0	EL2, EL1 and EL0 accesses to all activity monitor registers are not trapped to EL3.
0b1	EL2, EL1 and EL0 accesses to all activity monitor registers are trapped to EL3.

- The ACTLR_EL2.TAM (trap activity monitor access) bit traps Non-secure EL1 and EL0 accesses to all activity monitor registers to EL2.

0b0	Non-secure accesses from EL1 and EL0 to activity monitor registers are not trapped to EL2.
0b1	Non-secure accesses from EL1 and EL0 to activity monitor registers are trapped to EL2.

The TAM bit is allocated to bit [30] of ACTLR_EL3 and ACTLR_EL2.

The previously defined ACTLR_ELx.AMEN bits are now **RES0**.

5.8.10 AMEVCNTR1n_ELO, Activity Monitors Event Counter Registers 1n, ELO

The AMEVCNTR1n_ELO registers provide access to the auxiliary activity monitor event counters. The Cortex®-A78AE core implements three auxiliary counters so n is 0-2.

Bit field descriptions

The AMEVCNTR1n_ELO registers are 64-bit registers.

Figure 5-46: AMEVCNTR1n_ELO bit assignments

ACNT, [63:0]

Value of the activity counter AMEVCNTR1n_ELO.

This bit field resets to zero and the counters monitoring cycle events do not increment when the core is in WFI or WFE.

Configurations

There are no configuration notes.

Usage constraints

Accessing AMEVCNTR1n_ELO

To access AMEVCNTR1n_ELO:

```
MRS <Xt>, AMEVCNTR1n_ELO ; Read AMEVCNTR1n_ELO into Xt
```

Register access is encoded as follows:

Table 5-32: AMEVCNTR1n_ELO encoding

op0	op1	CRn	CRm	op2
3	3	c15	c12	n

AMEVCNTR1n_ELO[63:32] can also be accessed through the external memory-mapped interface, offset $0 \times 104 + 8n$. In this case, it is read-only.

AMEVCNTR1n_ELO[31:0] can also be accessed through the external memory-mapped interface, offset $0 \times 100 + 8n$. In this case, it is read-only.

This register is accessible as follows:

ELO	EL1	EL2	EL3
RO	RO	RO	RO

Traps and enables

The following control bits for traps on accesses to activity monitor registers are introduced:

- The ACTLR_EL3.TAM (trap activity monitor access) bit traps EL2, EL1 and ELO accesses to all activity monitor registers to EL3, from both Security states.

0b0 EL2, EL1 and ELO accesses to all activity monitor registers are not trapped to EL3.

0b1 EL2, EL1 and ELO accesses to all activity monitor registers are trapped to EL3.

- The ACTLR_EL2.TAM (trap activity monitor access) bit traps Non-secure EL1 and ELO accesses to all activity monitor registers to EL2.

0b0 Non-secure accesses from EL1 and ELO to activity monitor registers are not trapped to EL2.

0b1 Non-secure accesses from EL1 and ELO to activity monitor registers are trapped to EL2.

The TAM bit is allocated to bit [30] of ACTLR_EL3 and ACTLR_EL2.

The previously defined ACTLR_ELx.AMEN bits are now **RES0**.

5.8.11 AMEVTYPER0n_ELO, Activity Monitors Event Type Registers On, ELO

The AMEVTYPER0n_ELO registers provide information on the events that an architected, required activity monitor counter AMEVCNTR0n_ELO counts.

Bit field descriptions

The AMEVTYPER0n_ELO registers are 32-bit registers.

Figure 5-47: AMEVTYPER0n_ELO bit assignments

RAZ/WI, [31:25]

Read-As-Zero, Writes Ignored

RES0, [24:16]

RES0 Reserved

evtCount, [15:0]

The event the counter monitors might be fixed at implementation. In this case, the field is read-only. See [4.3.4 AMU events](#) on page 364.

Configurations

There are no configuration notes.

Usage constraints

Accessing AMEVTYPER0n_ELO

To access AMEVTYPER0n_ELO:

```
MRS <Xt>, AMEVTYPER0n_ELO ; Read AMEVTYPER0n_ELO into Xt
```

Register access is encoded as follows:

Table 5-34: AMEVTYPER0n_ELO encoding

op0	op1	CRn	CRm	op2
3	3	c15	c6	<n>

AMEVTYPER0n_ELO can be accessed through the external debug interface, offset 0x400+4n. In this case, it is read-only.

This register is accessible as follows:

ELO	EL1	EL2	EL3
RO	RO	RO	RO

Traps and enables

The following control bits for traps on accesses to activity monitor registers are introduced:

- The ACTLR_EL3.TAM (trap activity monitor access) bit traps EL2, EL1 and ELO accesses to all activity monitor registers to EL3, from both Security states.

0b0 EL2, EL1 and ELO accesses to all activity monitor registers are not trapped to EL3.

0b1 EL2, EL1 and ELO accesses to all activity monitor registers are trapped to EL3.

- The ACTLR_EL2.TAM (trap activity monitor access) bit traps Non-secure EL1 and ELO accesses to all activity monitor registers to EL2.

0b0 Non-secure accesses from EL1 and ELO to activity monitor registers are not trapped to EL2.

0b1 Non-secure accesses from EL1 and ELO to activity monitor registers are trapped to EL2.

The TAM bit is allocated to bit [30] of ACTLR_EL3 and ACTLR_EL2.

The previously defined ACTLR_ELx.AMEN bits are now **RES0**.

5.8.12 AMEVTYPER1n_ELO, Activity Monitors Event Type Registers 1n, ELO

The AMEVTYPER1n_ELO registers configure the event an auxiliary activity counter monitors, or define fixed-at-implementation event selection. The Cortex®-A78AE core implements three auxiliary counters so n is 0-2.

Bit field descriptions

The AMEVTYPER1n_ELO registers are 32-bit registers.

Figure 5-48: AMEVTYPER1n_ELO bit assignments

RAZ/WI, [31:25]

Read-As-Zero, Writes Ignored

RES0, [24:16]

RES0 Reserved

evtCount, [15:0]

Configurations

There are no configuration notes.

Usage constraints**Accessing AMEVTYPER1n_ELO**

To access AMEVTYPER1n_ELO:

```
MRS <Xt>, AMEVTYPER1n_ELO ; Read AMEVTYPER1n_ELO into Xt
```

Register access is encoded as follows:

Table 5-36: AMEVTYPER1n_ELO encoding

op0	op1	CRn	CRm	op2
3	3	c15	c14	n

AMEVTYPER1n_ELO can be accessed through the external debug interface, offset $0 \times 480 + 4n$. In this case, it is read-only.

This register is accessible as follows:

ELO	EL1	EL2	EL3
RO	RO	RO	RO

Traps and enables

The following control bits for traps on accesses to activity monitor registers are introduced:

- The ACTLR_EL3.TAM (trap activity monitor access) bit traps EL2, EL1 and ELO accesses to all activity monitor registers to EL3, from both Security states.

0b0 EL2, EL1 and ELO accesses to all activity monitor registers are not trapped to EL3.

0b1 EL2, EL1 and ELO accesses to all activity monitor registers are trapped to EL3.

- The ACTLR_EL2.TAM (trap activity monitor access) bit traps Non-secure EL1 and ELO accesses to all activity monitor registers to EL2.

0b0	Non-secure accesses from EL1 and ELO to activity monitor registers are not trapped to EL2.
0b1	Non-secure accesses from EL1 and ELO to activity monitor registers are trapped to EL2.

The TAM bit is allocated to bit [30] of ACTLR_EL3 and ACTLR_EL2.

The previously defined ACTLR_ELx.AMEN bits are now **RES0**.

5.8.13 AMUSERENR_ELO, Activity Monitors User Enable Register, ELO

AMUSERENR_ELO is the global user enable register for the activity monitors. It enables or disables ELO access to the activity monitors. AMUSERENR_ELO is applicable to both the architected and the auxiliary event counter groups.

Bit field descriptions

AMUSERENR_ELO is a 32-bit register.

Figure 5-49: AMUSERENR_ELO bit assignments

RES0, [31:4]

RES0 Reserved

RAZ/WI, [3:1]

Read-As-Zero, Writes Ignored

EN, [0]

Traps ELO accesses to the activity monitor registers to EL1. The possible values are:

0	ELO accesses to the activity monitor registers are trapped to EL1.
1	ELO accesses to the activity monitor registers are not trapped to EL1. Software can access all activity monitor registers at ELO.

Configurations

There are no configuration notes.

Usage constraints

Accessing AMUSERENR_ELO

To access AMUSERENR_ELO:

```
MRS <Xt>, AMUSERENR_ELO ; Read AMUSERENR_ELO into Xt
```

Register access is encoded as follows:

Table 5-38: AMUSERENR_ELO encoding

op0	op1	CRn	CRm	op2
3	3	c15	c2	3

AMUSERENR_ELO is excluded from the memory mapped view.

This register is accessible as follows:

ELO	EL1	EL2	EL3
RO	RO	RO	RO

Traps and enables

The following control bits for traps on accesses to activity monitor registers are introduced:

- The ACTLR_EL3.TAM (trap activity monitor access) bit traps EL2, EL1 and ELO accesses to all activity monitor registers to EL3, from both Security states.

0b0	EL2, EL1 and ELO accesses to all activity monitor registers are not trapped to EL3.
0b1	EL2, EL1 and ELO accesses to all activity monitor registers are trapped to EL3.
- The ACTLR_EL2.TAM (trap activity monitor access) bit traps Non-secure EL1 and ELO accesses to all activity monitor registers to EL2.

0b0	Non-secure accesses from EL1 and ELO to activity monitor registers are not trapped to EL2.
0b1	Non-secure accesses from EL1 and ELO to activity monitor registers are trapped to EL2.

The TAM bit is allocated to bit [30] of ACTLR_EL3 and ACTLR_EL2.

The previously defined ACTLR_ELx.AMEN bits are now **RES0**.

5.9 Memory-mapped AMU registers

This chapter describes the memory-mapped *Activity Monitor Unit* (AMU) registers. The memory-mapped interface provides read-only access to the AMU registers via the external debug interface.

5.9.1 Memory-mapped AMU register summary

There are *Activity Monitor Unit* (AMU) registers that are accessible through the external debug interface.

These registers are listed in the following table. For those registers not described in this chapter, see the [Arm® Architecture Reference Manual for A-profile architecture](#).

Table 5-40: Memory-mapped AMU register summary

Offset	Name	Type	Description
[63:32]: 0x004+8n [31:0]: 0x000+8n	AMEVCNTR0n	RO	5.8.9 AMEVCNTR0n_ELO , Activity Monitors Event Counter Registers 0n, ELO on page 445

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Architecture Reference Manual for A-profile architecture](#).

The AMCIDR3 can be accessed through the external debug interface, offset 0xFFC.

5.9.6 AMDEVAFF0, Activity Monitors Device Affinity Register 0

The AMDEVAFF0 provides an additional core identification mechanism for scheduling purposes in a cluster. AMDEVAFF0 is a read-only copy of MPIDR_EL1[31:0] accessible from the external debug interface.

Bit field descriptions

The AMDEVAFF0 is a 32-bit register and is a copy of the MPIDR register. See [3.2.111 MPIDR_EL1, Multiprocessor Affinity Register, EL1](#) on page 258 for full bit field descriptions.

5.9.7 AMDEVAFF1, Activity Monitors Device Affinity Register 1

The AMDEVAFF1 provides an additional core identification mechanism for scheduling purposes in a cluster. AMDEVAFF1 is a read-only copy of MPIDR_EL1[63:32] accessible from the external debug interface.

Bit field descriptions

The AMDEVAFF1 is a 32-bit register and is a copy of the MPIDR register. See [3.2.111 MPIDR_EL1, Multiprocessor Affinity Register, EL1](#) on page 258 for full bit field descriptions.

5.9.8 AMDEVARCH, Activity Monitors Device Architecture Register

The AMDEVARCH identifies the programmers' model architecture of the *Activity Monitor Unit* (AMU) component.

Bit field descriptions

The AMDEVARCH is a 32-bit register.

Figure 5-54: AMDEVARCH bit assignments**ARCHITECT, [31:21]**

Defines the architect of the component:

[31:28]	0x4, Arm JEP continuation
[27:21]	0x3B, Arm JEP 106 code

PRESENT, [20]

Indicates the presence of this register:

0b1	Register is present.
------------	----------------------

REVISION, [19:16]

Architecture revision:

0x00	Architecture revision 1
-------------	-------------------------

ARCHID, [15:0]

Architecture ID:

0x0A66	AMU architecture version AMUv1
---------------	--------------------------------

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Architecture Reference Manual for A-profile architecture](#).

The AMDEVARCH can be accessed through the external debug interface, offset 0xFBC.

5.9.9 AMDEVTYPE, Activity Monitors Device Type Register

The AMDEVTYPE indicates to a debugger that this component is part of a core's performance monitor interface.

Bit field descriptions

The AMDEVTYPE is a 32-bit register.

Figure 5-55: AMDEVTYPE bit assignments**RES0, [31:8]**

RES0 Reserved

SUB, [7:4]

The sub-type of the component:

0x1 Indicates this is a component within a core.

MAJOR, [3:0]

The main type of the component:

0x6 Indicates this is a performance monitor component.

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Architecture Reference Manual for A-profile architecture](#).

The AMDEVTYPE can be accessed through the external debug interface, offset 0xFCC.

5.9.10 AMIIDR, Activity Monitors Implementation Identification Register

The AMIIDR defines the implementer and revisions of the *Activity Monitor Unit* (AMU).

Bit field descriptions

AMIIDR is a 32-bit register.

Figure 5-56: AMIIDR_EL1 bit assignments**ProductID, [31:20]**

Indicates the AMU part identifier. This value is:

0xD42 The AMU part number

Variant, [19:16]

Indicates the variant number of the core. This is the major revision number x in the rx part of the rxdy description of the product revision status. This value is:

0x0 r0p3

Revision, [15:12]

Indicates the minor revision number of the core. This is the minor revision number y in the py part of the rxdy description of the product revision status. This value is:

0x3 r0p3

Implementer, [11:0]

Indicates the JEP106 code of the company that implemented the AMU. This value is:

0x43B Bits [11:8] contain the JEP106 continuation code of the implementer.

Bit [7] is **RES0**.

Bits [6:0] contain the JEP106 identity code of the implementer.

Bit fields and details that are not provided in this description are architecturally defined. See the [Arm® Architecture Reference Manual for A-profile architecture](#).

The AMIIDR can be accessed through the external debug interface, offset 0xE08.

5.9.11 AMPIDR0, Activity Monitors Peripheral Identification Register 0

The AMPIDR0 provides information to identify an activity monitors component.

Bit field descriptions

The AMPIDR0 is a 32-bit register.

Figure 5-57: AMPIDR0 bit assignments

RES0, [31:8]

Arm Limited. This is bits[3:0] of the JEP106 continuation code.

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Architecture Reference Manual for A-profile architecture](#).

The AMPIDR4 can be accessed through the external debug interface, offset 0xFD0.

5.10 ETM registers

This chapter describes the *Embedded Trace Macrocell* (ETM) registers.

5.10.1 ETM register summary

This section summarizes the *Embedded Trace Macrocell* (ETM) trace unit registers.

All ETM trace unit registers are 32-bit wide. The description of each register includes its offset from a base address. The base address is defined by the system integrator when placing the ETM trace unit in the Debug-APB memory map.

The following table lists all of the ETM trace unit registers.

Table 5-41: ETM trace unit register summary

Offset	Name	Type	Reset	Description
0x004	TRCPRGCTLR	RW	0x00000000	5.10.61 TRCPRGCTLR, Programming Control Register on page 521

5.10.2 TRCACATRn, Address Comparator Access Type Registers 0-7

The TRCACATRn registers control the access for the corresponding address comparators.

Bit field descriptions

The TRCACATRn registers are 64-bit registers.

Figure 5-62: TRCACATRn bit assignments

RES0, [63:16]

RES0 Reserved

EXLEVEL_NS, [15:12]

Each bit controls whether a comparison can occur in Non-secure state for the corresponding Exception level. The possible values are:

- | | |
|----------|---|
| 0 | The trace unit can perform a comparison, in Non-secure state, for Exception level <i>n</i> . |
| 1 | The trace unit does not perform a comparison, in Non-secure state, for Exception level <i>n</i> . |

The Exception levels are:

- | | |
|----------------|--------------------|
| Bit[12] | Exception level 0 |
| Bit[13] | Exception level 1 |
| Bit[14] | Exception level 2 |
| Bit[15] | Always RES0 |

EXLEVEL_S, [11:8]

Each bit controls whether a comparison can occur in Secure state for the corresponding Exception level. The possible values are:

- | | |
|----------|---|
| 0 | The trace unit can perform a comparison, in Secure state, for Exception level <i>n</i> . |
| 1 | The trace unit does not perform a comparison, in Secure state, for Exception level <i>n</i> . |

The Exception levels are:

Bit[8]	Exception level 0
Bit[9]	Exception level 1
Bit[10]	Always RES0
Bit[11]	Exception level 3

RES0, [7:4]

RES0	Reserved
-------------	----------

CONTEXT TYPE, [3:2]

Controls whether the trace unit performs a Context ID comparison, a VMID comparison, or both comparisons:

0b00	The trace unit does not perform a Context ID comparison.
0b01	The trace unit performs a Context ID comparison using the Context ID comparator that the CONTEXT field specifies, and signals a match if both the Context ID comparator matches and the address comparator match.
0b10	The trace unit performs a VMID comparison using the VMID comparator that the CONTEXT field specifies, and signals a match if both the VMID comparator and the address comparator match.
0b11	The trace unit performs a Context ID comparison and a VMID comparison using the comparators that the CONTEXT field specifies, and signals a match if the Context ID comparator matches, the VMID comparator matches, and the address comparator matches.

TYPE, [1:0]

Type of comparison:

5.10.5 TRCAUXCTLR, Auxiliary Control Register

The TRCAUXCTLR provides **IMPLEMENTATION DEFINED** configuration and control options.

Bit field descriptions

Figure 5-65: TRCAUXCTLR bit assignments

RES0, [31:9]

- RES0

Reserved

DBGFLUSHOVERRIDE, [8]

Override trace flush on Debug state entry. The possible values are:

- 0

Trace flush on Debug state entry is enabled.
- 1

Trace flush on Debug state entry is disabled.

CIFOVERRIDE, [7]

Override core interface register repeater clock enable. The possible values are:

- | | |
|----------|--|
| 0 | Core interface clock gate is enabled. |
| 1 | Core interface clock gate is disabled. |

INOVFLOWEN, [6]

Allow overflows of the core interface buffer, removing any rare impact that the trace unit might have on the core's speculation when enabled. The possible values are:

- | | |
|----------|---|
| 0 | Core interface buffer overflows are disabled. |
| 1 | Core interface buffer overflows are enabled. |

When this bit is set to 1, the trace start/stop logic might deviate from architecturally-specified behavior.

FLUSHOVERRIDE, [5]

Override ETM flush behavior. The possible values are:

- | | |
|----------|---|
| 0 | ETM trace unit FIFO is flushed and ETM trace unit enters idle state when DBGEN or NIDEN is LOW. |
| 1 | ETM trace unit FIFO is not flushed and ETM trace unit does not enter idle state when DBGEN or NIDEN is LOW. |

When this bit is set to 1, the trace unit behavior deviates from architecturally-specified behavior.

TSIOVERRIDE, [4]

Override TS packet insertion behavior. The possible values are:

- | | |
|----------|---|
| 0 | Timestamp packets are inserted into FIFO only when trace activity is LOW. |
| 1 | Timestamp packets are inserted into FIFO irrespective of trace activity. |

SYNCOVERRIDE, [3]

Override SYNC packet insertion behavior. The possible values are:

- | | |
|----------|--|
| 0 | SYNC packets are inserted into FIFO only when trace activity is low. |
| 1 | SYNC packets are inserted into FIFO irrespective of trace activity. |

FRSYNCOVFLOW, [2]

Force overflows to output synchronization packets. The possible values are:

- | | |
|----------|---|
| 0 | No FIFO overflow when SYNC packets are delayed. |
| 1 | Forces FIFO overflow when SYNC packets are delayed. |

When this bit is set to 1, the trace unit behavior deviates from architecturally-specified behavior.

IDLEACKOVERRIDE, [1]

Force ETM idle acknowledge. The possible values are:

- | | |
|---|--|
| 0 | ETM trace unit idle acknowledge is asserted only when the ETM trace unit is in idle state. |
| 1 | ETM trace unit idle acknowledge is asserted irrespective of the ETM trace unit idle state. |

When this bit is set to 1, trace unit behavior deviates from architecturally-specified behavior.

AFREADYOVERRIDE, [0]

Force assertion of AFREADYM output. The possible values are:

- | | |
|---|---|
| 0 | ETM trace unit AFREADYM output is asserted only when the ETM trace unit is in idle state or when all the trace bytes in FIFO before a flush request are output. |
| 1 | ETM trace unit AFREADYM output is always asserted HIGH. |

When this bit is set to 1, trace unit behavior deviates from architecturally-specified behavior.

The TRCAUXCTLR can be accessed through the internal memory-mapped interface and the external debug interface, offset 0x018.

Configurations

Available in all configurations.

5.10.6 TRCBBCTLR, Branch Broadcast Control Register

The TRCBBCTLR controls how branch broadcasting behaves, and allows branch broadcasting to be enabled for certain memory regions.

Bit field descriptions

The TRCBBCTLR is a 32-bit register.

Figure 5-66: TRCBBCTLR bit assignments

RES0, [31:9]

RES0 Reserved

MODE, [8]

Mode bit:

- | | |
|----------|---|
| 0 | Exclude mode. Branch broadcasting is not enabled in the address range that RANGE defines. |
| 1 | <p>Include mode. Branch broadcasting is enabled in the address range that RANGE defines.</p> <p>If RANGE==0 then the behavior of the trace unit is CONSTRAINED UNPREDICTABLE. That is, the trace unit might or might not consider any instructions to be in a branch broadcast region.</p> |

RANGE, [7:0]

Address range field

Selects which address range comparator pairs are in use with branch broadcasting. Each bit represents an address range comparator pair, so bit[*n*] controls the selection of address range comparator pair *n*. If bit[*n*] is:

- | | |
|----------|---|
| 0 | The address range that address range comparator pair <i>n</i> defines, is not selected. |
| 1 | The address range that address range comparator pair <i>n</i> defines, is selected. |

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Embedded Trace Macrocell Architecture Specification ETMv4](#).

The TRCBBCTLR can be accessed through the external debug interface, offset 0x03C.

5.10.7 TRCCCCTLR, Cycle Count Control Register

The TRCCCCTLR sets the threshold value for cycle counting.

Bit field descriptions

The TRCCCCTLR is a 32-bit register.

Figure 5-67: TRCCCCTLR bit assignments

------	----------

THRESHOLD, [11:0]

Instruction trace cycle count threshold

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Embedded Trace Macrocell Architecture Specification ETMv4](#).

The TRCCCCTLR can be accessed through the external debug interface, offset 0x038.

5.10.8 TRCCIDCCTL0, Context ID Comparator Control Register 0

The TRCCIDCTRL0 controls the mask value for the context ID comparators.

Bit field descriptions

The TRCCIDCCTRL0 is a 32-bit register.

Figure 5-68: TRCCIDCCTLR0 bit assignments

RES0, [31:4]

RES0 Reserved

COMP0, [3:0]

Controls the mask value that the trace unit applies to TRCCIDCVR0. Each bit in this field corresponds to a byte in TRCCIDCVR0. When a bit is:

- | | |
|---|---|
| 0 | The trace unit includes the relevant byte in TRCCIDCVR0 when it performs the Context ID comparison. |
| 1 | The trace unit ignores the relevant byte in TRCCIDCVR0 when it performs the Context ID comparison. |

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Embedded Trace Macrocell Architecture Specification ETMv4](#).

The TRCCIDCCTRL0 can be accessed through the external debug interface, offset 0x680.

5.10.9 TRCCIDCVR0, Context ID Comparator Value Register 0

The TRCCIDCVR0 contains a Context ID value.

Bit field descriptions

The TRCCIDCVR0 is a 64-bit register.

| 0 | Claim tag bit is not set. |
| 1 | Claim tag bit is set. |

On writes, for each bit:

- | | |
|---|---|
| 0 | Has no effect. |
| 1 | Clears the relevant bit of the claim tag. |

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Embedded Trace Macrocell Architecture Specification ETMv4](#) .

The TRCCLAIMCLR can be accessed through the external debug interface, offset 0xFA4.

5.10.15 TRCCLAIMSET, Claim Tag Set Register

The TRCCLAIMSET sets bits in the claim tag and determines the number of claim tag bits implemented.

Bit field descriptions

The TRCCLAIMSET is a 32-bit register.

Figure 5-75: TRCCLAIMSET bit assignments

RES0, [31:4]

RES0 Reserved

SET, [3:0]

On reads, for each bit:

0	Claim tag bit is not implemented.
1	Claim tag bit is implemented.

On writes, for each bit:

0	Has no effect.
1	Sets the relevant bit of the claim tag.

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Embedded Trace Macrocell Architecture Specification ETMv4](#).

The TRCCLAIMSET can be accessed through the external debug interface, offset 0xFA0.

5.10.16 TRCNTCTLR0, Counter Control Register 0

The TRCNTCTLR0 controls the counter.

Bit field descriptions

The TRCNTCTLR0 is a 32-bit register.

Figure 5-76: TRCCNTCTLR0 bit assignments**RES0, [31:17]**

RES0 Reserved

RLDSELF, [16]

Defines whether the counter reloads when it reaches zero:

- | | |
|----------|--|
| 0 | The counter does not reload when it reaches zero. The counter only reloads based on RLDTYPE and RLDSEL. |
| 1 | The counter reloads when it reaches zero and the resource selected by CNTTYPE and CNTSEL is also active. The counter also reloads based on RLDTYPE and RLDSEL. |

RLDTYPE, [15]

Selects the resource type for the reload:

- | | |
|----------|--------------------------------|
| 0 | Single selected resource |
| 1 | Boolean combined resource pair |

RES0, [14:12]

RES0 Reserved

RLDSEL, [11:8]

Selects the resource number, based on the value of RLDTYPE:

When RLDTYPE is 0, selects a single selected resource from 0-15 defined by bits[3:0].

When RLDTYPE is 1, selects a Boolean combined resource pair from 0-7 defined by bits[2:0].

CNTTYPE, [7]

Selects the resource type for the counter:

- | | |
|----------|--------------------------------|
| 0 | Single selected resource |
| 1 | Boolean combined resource pair |

RES0, [6:4]

RES0 Reserved

CNTSEL, [3:0]

Selects the resource number, based on the value of CNTTYPE:

When CNTTYPE is 0, selects a single selected resource from 0-15 defined by bits[3:0].

When CNTTYPE is 1, selects a Boolean combined resource pair from 0-7 defined by bits[2:0].

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Embedded Trace Macrocell Architecture Specification ETMv4](#).

The TRCCNTCTLR0 can be accessed through the external debug interface, offset 0x150.

5.10.17 TRCCNTCTLR1, Counter Control Register 1

The TRCCNTCTLR1 controls the counter.

Bit field descriptions

The TRCCNTCTLR1 is a 32-bit register.

Figure 5-77: TRCCNTCTLR1 bit assignments

**RES0, [31:18]**

RES0

Reserved

CNTCHAIN, [17]

Defines whether the counter decrements when the counter reloads. This enables two counters to be used in combination to provide a larger counter:

- | | |
|----------|--|
| 0 | The counter operates independently from the counter. The counter only decrements based on CNTTYPE and CNTSEL. |
| 1 | The counter decrements when the counter reloads. The counter also decrements when the resource selected by CNTTYPE and CNTSEL is active. |

RLDSELF, [16]

Defines whether the counter reloads when it reaches zero:

0	The counter does not reload when it reaches zero. The counter only reloads based on RLDTYPE and RLDSEL.
1	The counter reloads when it is zero and the resource selected by CNTTYPE and CNTSEL is also active. The counter also reloads based on RLDTYPE and RLDSEL.

RLDTYPE, [15]

Selects the resource type for the reload:

0	Single selected resource
1	Boolean combined resource pair

RES0, [14:12]

RES0	Reserved
-------------	----------

RLDSEL, [11:8]

Selects the resource number, based on the value of RLDTYPE:

When RLDTYPE is 0, selects a single selected resource from 0-15 defined by bits[3:0].

When RLDTYPE is 1, selects a Boolean combined resource pair from 0-7 defined by bits[2:0].

CNTTYPE, [7]

Selects the resource type for the counter:

0	Single selected resource
1	Boolean combined resource pair

RES0, [6:4]

RES0	Reserved
-------------	----------

CNTSEL, [3:0]

Selects the resource number, based on the value of CNTTYPE:

When CNTTYPE is 0, selects a single selected resource from 0-15 defined by bits[3:0].

When CNTTYPE is 1, selects a Boolean combined resource pair from 0-7 defined by bits[2:0].

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Embedded Trace Macrocell Architecture Specification ETMv4](#).

The TRCCNTCTLR1 can be accessed through the external debug interface, offset 0x154.

5.10.18 TRCCNTRLDVRn, Counter Reload Value Registers 0-1

The TRCCNTRLDVRn registers define the reload value for the counter.

Bit field descriptions

The TRCCNTRLDVRn registers are 32-bit registers.

Figure 5-78: TRCCNTRLDVRn bit assignments

RES0, [31:16]

RES0 Reserved

VALUE, [15:0]

Defines the reload value for the counter. This value is loaded into the counter each time the reload event occurs.

5.10.20 TRCCONFIGR, Trace Configuration Register

The TRCCONFIGR controls the tracing options.

Bit field descriptions

The TRCCONFIGR is a 32-bit register.

Figure 5-80: TRCCONFIGR bit assignments

RES0, [31:18]

RES0	Reserved
-------------	----------

DV, [17]

Read-As-Zero (RAZ). Data value tracing is not supported.

DA, [16]

RAZ. Data address tracing is not supported.

VMIDOPT, [15]

Configures the Virtual context identifier value used by the trace unit, both for trace generation and in the Virtual context identifier comparators. The possible values are:

0b0	VTTBR_EL2.VMID is used. If the trace unit supports a Virtual context identifier larger than the VTTBR_EL2.VMID, the upper unused bits are always zero. If the trace unit supports a Virtual context identifier larger than 8 bits and if the VTCR_EL2.VS bit forces use of an 8-bit Virtual context identifier, bits [15:8] of the trace unit Virtual context identifier are always zero.
0b1	CONTEXTIDR_EL2 is used. TRCIDR2.VMIDOPT indicates whether this field is implemented.

QE, [14:13]

Enables Q element. The possible values are:

0b00	Q elements are disabled.
0b01	Q elements with instruction counts are disabled. Q elements without instruction counts are disabled.
0b10	Reserved
0b11	Q elements with and without instruction counts are enabled.

RS, [12]

Enables the return stack. The possible values are:

0	Disables the return stack.
1	Enables the return stack.

TS, [11]

Enables global timestamp tracing. The possible values are:

0	Disables global timestamp tracing.
1	Enables global timestamp tracing.

COND, [10:8]

Enables conditional instruction tracing. The possible values are:

0b000	Conditional instruction tracing is disabled.
0b001	Conditional load instructions are traced.

0b010	Conditional store instructions are traced.
0b011	Conditional load and store instructions are traced.
0b111	All conditional instructions are traced.

VMID, [7]

Enables VMID tracing. The possible values are:

0	Disables VMID tracing.
1	Enables VMID tracing.

CID, [6]

Enables context ID tracing. The possible values are:

0	Disables context ID tracing.
1	Enables context ID tracing.

RES0, [5]

RES0	Reserved
-------------	----------

CCI, [4]

Enables cycle counting instruction trace. The possible values are:

0	Disables cycle counting instruction trace.
1	Enables cycle counting instruction trace.

BB, [3]

Enables branch broadcast mode. The possible values are:

0	Disables branch broadcast mode.
1	Enables branch broadcast mode.

INSTP0, [2:1]

Controls whether load and store instructions are traced as P0 instructions. The possible values are:

0b00	Load and store instructions are not traced as P0 instructions.
0b01	Load instructions are traced as P0 instructions.
0b10	Store instructions are traced as P0 instructions.
0b11	Load and store instructions are traced as P0 instructions.

RES1, [0]

RES1	Reserved
-------------	----------

The TRCCONFIGR can be accessed through the external debug interface, offset 0x010.

5.10.21 TRCDEVAFF0, Device Affinity Register 0

The TRCDEVAFF0 provides an additional core identification mechanism for scheduling purposes in a cluster. TRCDEVAFF0 is a read-only copy of MPIDR accessible from the external debug interface.

Bit field descriptions

The TRCDEVAFF0 is a 32-bit register and is a copy of the MPIDR_EL1[31:0]. See [3.2.111 MPIDR_EL1, Multiprocessor Affinity Register, EL1](#) on page 258 for full bit field descriptions.

5.10.22 TRCDEVAFF1, Device Affinity Register 1

The TRCDEVAFF1 is a read-only copy of MPIDR_EL1[63:32] as seen from EL3, unaffected by VMPIDR_EL2.

Bit field descriptions

See [3.2.111 MPIDR_EL1, Multiprocessor Affinity Register, EL1](#) on page 258 for full bit field descriptions.

5.10.23 TRCDEVARCH, Device Architecture Register

The TRCDEVARCH identifies the ETM trace unit as an ETMv4 component.

Bit field descriptions

The TRCDEVARCH is a 32-bit register.

Figure 5-81: TRCDEVARCH bit assignments

ARCHITECT, [31:21]

Defines the architect of the component:

[31:28]	0x4, Arm JEP continuation
[27:21]	0x3B, Arm JEP 106 code

PRESENT, [20]

Indicates the presence of this register:

0b1	Register is present.

RES0, [31]

RES0 Reserved

VMIDOPT, [30:29]

Indicates the options for observing the Virtual context identifier:

0x1 VMIDOPT implemented

CCSIZE, [28:25]

Size of the cycle counter in bits minus 12:

0x0 The cycle counter is 12 bits in length.

DVSIZE, [24:20]

Data value size in bytes:

0x00 Data value tracing is not implemented.

DASIZE, [19:15]

Data address size in bytes:

0x00 Data address tracing is not implemented.

VMIDSIZE, [14:10]

Virtual Machine ID size:

0x4 Maximum of 32-bit Virtual Machine ID size

CIDSIZE, [9:5]

Context ID size in bytes:

0x4 Maximum of 32-bit Context ID size

IASIZE, [4:0]

Instruction address size in bytes:

0x8 Maximum of 64-bit address size

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Embedded Trace Macrocell Architecture Specification ETMv4](#).

The TRCIDR2 can be accessed through the external debug interface, offset 0x1E8.

5.10.32 TRCIDR3, ID Register 3

The TRCIDR3 indicates:

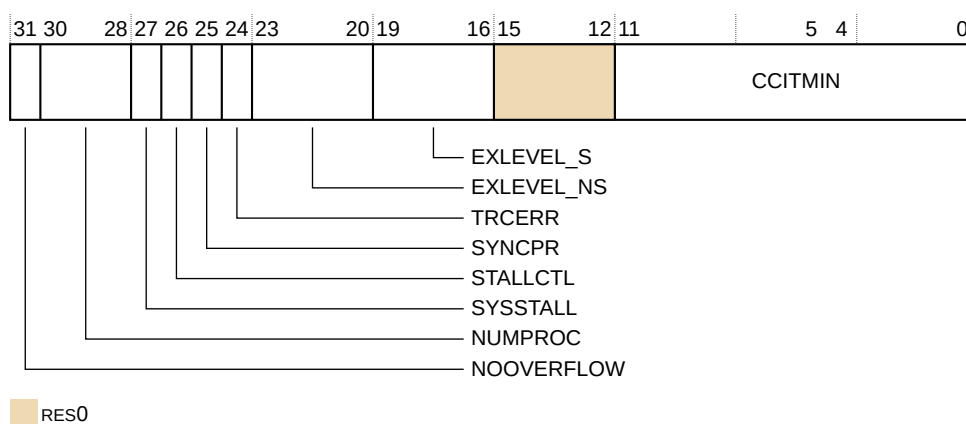

- Whether TRCVICTLR is supported.
- The number of cores available for tracing.

- If an Exception level supports instruction tracing.
- The minimum threshold value for instruction trace cycle counting.
- Whether the synchronization period is fixed.
- Whether TRCSTALLCTLR is supported and if so whether it supports trace overflow prevention and supports stall control of the core.

Bit field descriptions

The TRCIDR3 is a 32-bit register.

Figure 5-90: TRCIDR3 bit assignments

NOOVERFLOW, [31]

Indicates whether TRCSTALLCTLR.NOOVERFLOW is implemented:

0 TRCSTALLCTLR.NOOVERFLOW is not implemented.

NUMPROC, [30:28]

Indicates the number of cores available for tracing:

0b000 The trace unit can trace one core, ETM trace unit sharing not supported.

SYSSTALL, [27]

Indicates whether stall control is implemented:

0 The system does not support core stall control.

STALLCTL, [26]

Indicates whether TRCSTALLCTLR is implemented:

0 TRCSTALLCTLR is not implemented.

This field is used in conjunction with SYSSTALL.

SYNCPR, [25]

Indicates whether there is a fixed synchronization period:

0	TRCSYNCP is read/write so software can change the synchronization period.
---	---

TRCERR, [24]

Indicates whether TRCVICTLR.TRCERR is implemented:

1	TRCVICTLR.TRCERR is implemented.
---	----------------------------------

EXLEVEL_NS, [23:20]

Each bit controls whether instruction tracing in Non-secure state is implemented for the corresponding Exception level:

0b0111	Instruction tracing is implemented for Non-secure EL0, EL1, and EL2 Exception levels.
--------	---

EXLEVEL_S, [19:16]

Each bit controls whether instruction tracing in Secure state is implemented for the corresponding Exception level:

0b1011	Instruction tracing is implemented for Secure EL0, EL1, and EL3 Exception levels.
--------	---

RES0, [15:12]

RES0	Reserved
------	----------

CCITMIN, [11:0]

The minimum value that can be programmed in TRCCCCTLR.THRESHOLD:

0x004	Instruction trace cycle counting minimum threshold is 4.
-------	--

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Embedded Trace Macrocell Architecture Specification ETMv4](#).

The TRCIDR3 can be accessed through the external debug interface, offset 0x1EC.

5.10.33 TRCIDR4, ID Register 4

The TRCIDR4 indicates the resources available in the ETM trace unit.

Bit field descriptions

The TRCIDR4 is a 32-bit register.

Figure 5-91: TRCIDR4 bit assignments**NUMVMIDC, [31:28]**

Indicates the number of VMID comparators available for tracing:

0x1 One VMID comparator is available.

NUMCIDC, [27:24]

Indicates the number of CID comparators available for tracing:

0x1 One Context ID comparator is available.

NUMSSCC, [23:20]

Indicates the number of single-shot comparator controls available for tracing:

0x1 One single-shot comparator control is available.

NUMRSPAIRS, [19:16]

Indicates the number of resource selection pairs available for tracing:

0x7 Eight resource selection pairs are available.

NUMPC, [15:12]

Indicates the number of core comparator inputs available for tracing:

0x0 Core comparator inputs are not implemented.

RES0, [11:9]

RES0 Reserved

SUPPDAC, [8]

Indicates whether the implementation supports data address comparisons: This value is:

0 Data address comparisons are not implemented.

NUMDVC, [7:4]

Indicates the number of data value comparators available for tracing:

0x0 Data value comparators are not implemented.

NUMACPAIRS, [3:0]

Indicates the number of address comparator pairs available for tracing:

0x4 Four address comparator pairs are implemented.

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Embedded Trace Macrocell Architecture Specification ETMv4](#).

The TRCIDR4 can be accessed through the external debug interface, offset 0x1F0.

5.10.34 TRCIDR5, ID Register 5

The TRCIDR5 returns how many resources the trace unit supports.

Bit field descriptions

Figure 5-92: TRCIDR5 bit assignments

**REDFUNCNTR, [31]**

Reduced Function Counter implemented:

0 Reduced Function Counter not implemented

NUMCNTR, [30:28]

Number of counters implemented:

Number of external inputs implemented:

0xD6	214 external inputs implemented.
-------------	----------------------------------

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Embedded Trace Macrocell Architecture Specification ETMv4](#).

The TRCIDR5 can be accessed through the external debug interface, offset 0x1F4.

5.10.35 TRCIDR8, ID Register 8

The TRCIDR8 returns the maximum speculation depth of the instruction trace stream.

Bit field descriptions

The TRCIDR8 is a 32-bit register.

Figure 5-93: TRCIDR8 bit assignments

MAXSPEC, [31:0]

The maximum number of PO elements in the trace stream that can be speculative at any time.

0 Maximum speculation depth of the instruction trace stream

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Embedded Trace Macrocell Architecture Specification ETMv4](#).

The TRCIDR8 can be accessed through the external debug interface, offset 0x180.

5.10.36 TRCIDR9, ID Register 9

The TRCIDR9 returns the number of PO right-hand keys that the trace unit can use.

Bit field descriptions

The TRCIDR9 is a 32-bit register.

Figure 5-94: TRCIDR9 bit assignments**NUMPOKEY, [31:0]**

The number of PO right-hand keys that the trace unit can use.

0 Number of PO right-hand keys

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Embedded Trace Macrocell Architecture Specification ETMv4](#).

The TRCIDR9 can be accessed through the external debug interface, offset 0x184.

5.10.37 TRCIDR10, ID Register 10

The TRCIDR10 returns the number of P1 right-hand keys that the trace unit can use.

Bit field descriptions

The TRCIDR10 is a 32-bit register.

Figure 5-95: TRCIDR10 bit assignments

NUMP1KEY, [31:0]

The number of P1 right-hand keys that the trace unit can use.

0 Number of P1 right-hand keys

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Embedded Trace Macrocell Architecture Specification ETMv4](#).

The TRCIDR10 can be accessed through the external debug interface, offset 0x188.

5.10.38 TRCIDR11, ID Register 11

The TRCIDR11 returns the number of special P1 right-hand keys that the trace unit can use.

Bit field descriptions

The TRCIDR11 is a 32-bit register.

Figure 5-96: TRCIDR11 bit assignments**NUMP1SPC, [31:0]**

The number of special P1 right-hand keys that the trace unit can use.

0 Number of special P1 right-hand keys

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Embedded Trace Macrocell Architecture Specification ETMv4](#).

The TRCIDR11 can be accessed through the external debug interface, offset 0x18C.

5.10.39 TRCIDR12, ID Register 12

The TRCIDR12 returns the number of conditional instruction right-hand keys that the trace unit can use.

Bit field descriptions

The TRCIDR12 is a 32-bit register.

Figure 5-97: TRCIDR12 bit assignments

NUMCONDKEY, [31:0]

The number of conditional instruction right-hand keys that the trace unit can use, including normal and special keys.

0 Number of conditional instruction right-hand keys

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Embedded Trace Macrocell Architecture Specification ETMv4](#) .

The TRCIDR12 can be accessed through the external debug interface, offset 0x190.

5.10.40 TRCIDR13, ID Register 13

The TRCIDR13 returns the number of special conditional instruction right-hand keys that the trace unit can use.

Bit field descriptions

The TRCIDR13 is a 32-bit register.

Figure 5-98: TRCIDR13 bit assignments

**NUMCONDSPC, [31:0]**

The number of special conditional instruction right-hand keys that the trace unit can use, including normal and special keys.

0 Number of special conditional instruction right-hand keys

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Embedded Trace Macrocell Architecture Specification ETMv4](#) .

The TRCIDR13 can be accessed through the external debug interface, offset 0x194.

5.10.41 TRCIMSPECO, IMPLEMENTATION SPECIFIC Register 0

The TRCIMSPECO shows the presence of any **IMPLEMENTATION SPECIFIC** features, and enables any features that are provided.

Bit field descriptions

The TRCIMSPECO is a 32-bit register.

Figure 5-99: TRCIMSPECO bit assignments**RES0, [31:4]**

RES0	Reserved
------	----------

SUPPORT, [3:0]

0	No IMPLEMENTATION SPECIFIC extensions supported
---	--

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Embedded Trace Macrocell Architecture Specification ETMv4](#).

The TRCIMSPECO can be accessed through the external debug interface, offset 0x1C0.

System register accesses to the TRCIMSPECO will result in an **UNDEFINED** exception.

5.10.42 TRCITATBCTRO, Trace Integration Test ATB Control Register 0

TRCITATBCTRO controls signal outputs when TRCITCTRL.IME is set.

Bit field descriptions

The TRCITATBCTRO is a 32-bit register.

Figure 5-100: TRCITATBCTRO bit assignments**RES0, [31:10]**

RES0	Reserved
------	----------

- ATBYTESM[1:0], [9:8]**
Drives the ATBYTESM outputs.

ATDATAM[7], [1]

Drives the ATDATAM[7] output.

ATDATAM[0], [0]

Drives the ATDATAM[0] output.

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Embedded Trace Macrocell Architecture Specification ETMv4](#).

The TRCITATBDATA0 register can be accessed through the internal memory-mapped interface and the external debug interface, offset 0xEEC.

5.10.46 TRCITCTRL, Trace Integration Mode Control register

TRCITCTRL controls whether the trace unit is in integration mode.

Bit field descriptions

The TRCITCTRL is a 32-bit RW management register that is reset to zero.

Figure 5-104: TRCITCTRL bit assignments**RES0, [31:1]**

RES0 Reserved

IME, [0]

Integration mode enable bit. The possible values are:

- | | |
|------------|---|
| 0b0 | The trace unit is not in integration mode. |
| 0b1 | The trace unit is in integration mode. This mode enables: <ul style="list-style-type: none"> • A debug agent to perform topology detection. • SoC test software to perform integration testing. |

Usage constraints

- Accessible only from the memory-mapped interface or from an external agent such as a debugger.
- If the IME bit changes from one to zero then Arm recommends that the trace unit is reset. Otherwise the trace unit might generate incorrect or corrupt trace and the trace unit resources might behave unexpectedly.

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Embedded Trace Macrocell Architecture Specification ETMv4](#).

The TRCITCTRL register can be accessed through the internal memory-mapped interface and the external debug interface, offset 0xF00.

5.10.47 TRCITMISCIN, Trace Integration Miscellaneous Input Register

TRCITMISCIN enables the values of signal inputs to be read when TRCITCTRL.IME is set.

Bit field descriptions

The TRCITMISCIN is a 32-bit register.

Figure 5-105: TRCITMISCIN bit assignments**RES0, [31:4]**

RES0 Reserved

ETMEXTIN[3:0], [3:0]

5.10.49 TRCLAR, Software Lock Access Register

The TRCLAR controls access to registers using the memory-mapped interface, when PADDRDBG31 is LOW.

Bit field descriptions

The TRCLAR is a 32-bit register.

Figure 5-107: TRCLAR bit assignments

RAZ/WI, [31:0]

Read-As-Zero, write ignore

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Embedded Trace Macrocell Architecture Specification ETMv4](#).

The TRCLAR can be accessed through the external debug interface, offset 0xFB0.

5.10.50 TRCLSR, Software Lock Status Register

The TRCLSR determines whether the software lock is implemented, and indicates the current status of the software lock.

Bit field descriptions

The TRCLSR is a 32-bit register.

Figure 5-108: TRCLSR bit assignments

RAZ/WI, [31:0]
Read-As-Zero, write ignore

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Embedded Trace Macrocell Architecture Specification ETMv4](#) .

The TRCLSR can be accessed through the external debug interface, offset 0xFB4.

5.10.51 TRCOSLAR, OS Lock Access Register

The TRCOSLAR sets and clears the OS Lock, to lock out external debugger accesses to the ETM trace unit registers.

Bit field descriptions
The TRCOSLAR is a 32-bit register.

The TRCOSLAR can be accessed through the external debug interface, offset 0x300.

5.10.52 TRCOSLSR, OS Lock Status Register

The TRCOSLSR returns the status of the OS Lock.

Bit field descriptions

The TRCOSLSR is a 32-bit register.

Figure 5-110: TRCOSLSR bit assignments

RES0, [31:4]

RES0 Reserved

OSLM[1], [3]

OS Lock model [1] bit. This bit is combined with OSLM[0] to form a two-bit field that indicates the OS Lock model is implemented.

The value of this field is always 0b10, indicating that the OS Lock is implemented.

nTT, [2]

This bit is RAZ, that indicates that software must perform a 32-bit write to update the TRCOSLAR.

OSLK, [1]

OS Lock status bit:

0	OS Lock is unlocked.
1	OS Lock is locked.

OSLM[0], [0]

OS Lock model [0] bit. This bit is combined with OSLM[1] to form a two-bit field that indicates the OS Lock model is implemented.

The value of this field is always 0b10, indicating that the OS Lock is implemented.

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Embedded Trace Macrocell Architecture Specification ETMv4](#).

The TRCOSLSR can be accessed through the external debug interface, offset 0x304.

5.10.53 TRCPDCR, Power Down Control Register

The TRCPDCR request to the system power controller to keep the ETM trace unit powered up.

Bit field descriptions

The TRCPDCR is a 32-bit register.

Figure 5-111: TRCPDCR bit assignments

RES0, [31:4]

RES0	Reserved
-------------	----------

PU, [3]

Powerup request, to request that power to the ETM trace unit and access to the trace registers is maintained:

0	Power not requested
1	Power requested

This bit is reset to 0 on a trace unit reset.

RES0, [2:0]

RES0	Reserved
------	----------

EN, [0]

Trace program enable:

- | | |
|---|--|
| 0 | The ETM trace unit interface in the core is disabled, and clocks are enabled only when necessary to process APB accesses, or drain any already generated trace. This is the reset value. |
| 1 | The ETM trace unit interface in the core is enabled, and clocks are enabled. Writes to most trace registers are IGNORED . |

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Embedded Trace Macrocell Architecture Specification ETMv4](#).

The TRCPRGCTLR can be accessed through the external debug interface, offset 0x004.

5.10.62 TRCRSCTLRn, Resource Selection Control Registers 2-15

The TRCRSCTLRn registers control the trace resources. There are eight resource pairs, the first pair is predefined as {0,1,pair=0} and having reserved select registers. This leaves seven pairs to be implemented as programmable selectors.

Bit field descriptions

The TRCRSCTLRn registers are 32-bit registers.

Figure 5-119: TRCRSCTLRn bit assignments**RES0, [31:22]**

RES0 Reserved

PAIRINV, [21]

Inverts the result of a combined pair of resources.

This bit is implemented only on the lower register for a pair of resource selectors.

INV, [20]

Inverts the selected resources:

0	Resource is not inverted.
1	Resource is inverted.

RES0, [19]

RES0 Reserved

GROUP, [18:16]

Selects a group of resources. See the *Arm® ETM Architecture Specification, ETMv4* for more information.

RES0, [15:8]

RES0 Reserved

SELECT, [7:0]

Selects one or more resources from the required group. One bit is provided for each resource from the group.

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Embedded Trace Macrocell Architecture Specification ETMv4](#).

The TRCRSCTLRn can be accessed through the external debug interface, offset 0x208–0x023C.

5.10.63 TRCSEQEVRn, Sequencer State Transition Control Registers 0-2

The TRCSEQEVRn registers define the sequencer transitions that progress to the next state or backwards to the previous state. The ETM trace unit implements a sequencer state machine with up to four states.

Bit field descriptions

The TRCSEQEVRn registers are 32-bit registers.

Figure 5-120: TRCSEQEVRn bit assignments

RES0, [31:16]

RES0 Reserved

B TYPE, [15]

Selects the resource type to move backwards to this state from the next state:

0	Single selected resource
1	Boolean combined resource pair

RES0, [14:12]

RES0 Reserved

B SEL, [11:8]

Selects the resource number, based on the value of B TYPE:

When B TYPE is 0, selects a single selected resource from 0-15 defined by bits[3:0].

When B TYPE is 1, selects a Boolean combined resource pair from 0-7 defined by bits[2:0].

F TYPE, [7]

Selects the resource type to move forwards from this state to the next state:

0	Single selected resource
1	Boolean combined resource pair

RES0, [6:4]

RES0 Reserved

F SEL, [3:0]

Selects the resource number, based on the value of F TYPE:

When F TYPE is 0, selects a single selected resource from 0-15 defined by bits[3:0].

When F TYPE is 1, selects a Boolean combined resource pair from 0-7 defined by bits[2:0].

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Embedded Trace Macrocell Architecture Specification ETMv4](#) .

The TRCSEQEVRn registers can be accessed through the external debug interface, offsets:

TRCSEQEVR0

0x100

TRCSEQEVR1

0x104

TRCSEQEVR2

0x108

5.10.64 TRCSEQRSTEVR, Sequencer Reset Control Register

The TRCSEQRSTEVR resets the sequencer to state 0.

Bit field descriptions

The TRCSEQRSTEVR is a 32-bit register

Figure 5-121: TRCSEQRSTEVR bit assignments

RES0, [31:8]

RES0 Reserved

RESETTYPE, [7]

Selects the resource type to move back to state 0:

- | | |
|---|--------------------------------|
| 0 | Single selected resource |
| 1 | Boolean combined resource pair |

RES0, [6:4]

RES0	Reserved
------	----------

RESETSEL, [3:0]

Selects the resource number, based on the value of RESETTYPE:

When RESETTYPE is 0, selects a single selected resource from 0-15 defined by bits[3:0].

When RESETTYPE is 1, selects a Boolean combined resource pair from 0-7 defined by bits[2:0].

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Embedded Trace Macrocell Architecture Specification ETMv4](#) .

The TRCSEQRSTEVr can be accessed through the external debug interface, offset 0x118.

5.10.65 TRCSEQSTR, Sequencer State Register

The TRCSEQSTR holds the value of the current state of the sequencer.

Bit field descriptions

The TRCSEQSTR is a 32-bit register

Figure 5-122: TRCSEQSTR bit assignments

RES0, [31:2]

RES0	Reserved
------	----------

STATE, [1:0]

Current sequencer state:

0b00	State 0
0b01	State 1
0b10	State 2
0b11	State 3

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Embedded Trace Macrocell Architecture Specification ETMv4](#) .

The TRCSEQSTR can be accessed through the external debug interface, offset 0x11C.

5.10.66 TRCSSCCR0, Single-Shot Comparator Control Register 0

The TRCSSCCR0 controls the single-shot comparator.

Bit field descriptions

The TRCSSCSR0 is a 32-bit register

Figure 5-123: TRCSSCCR0 bit assignments

RES0, [31:25]

RES0 Reserved

RST, [24]

Enables the single-shot comparator resource to be reset when it occurs, to enable another comparator match to be detected:

1 Reset enabled. Multiple matches can occur.

RES0, [23:20]

RES0 Reserved

ARC, [19:16]

Selects one or more address range comparators for single-shot control.

One bit is provided for each implemented address range comparator.

RES0, [15:8]

RES0 Reserved

SAC, [7:0]

Selects one or more single address comparators for single-shot control.

One bit is provided for each implemented single address comparator.

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Embedded Trace Macrocell Architecture Specification ETMv4](#).

The TRCSSCCR0 can be accessed through the external debug interface, offset 0x280.

5.10.67 TRCSSCSR0, Single-Shot Comparator Status Register 0

The TRCSSCSR0 indicates the status of the single-shot comparator. TRCSSCSR0 is sensitive to instruction addresses.

Bit field descriptions

The TRCSSCSR0 is a 32-bit register

Figure 5-124: TRCSSCSR0 bit assignments

STATUS, [31]

Single-shot status. This indicates whether any of the selected comparators have matched:

- | | |
|---|-----------------------------------|
| 0 | Match has not occurred. |
| 1 | Match has occurred at least once. |

When programming the ETM trace unit, if TRCSSCCRn.RST is b0, the STATUS bit must be explicitly written to 0 to enable this single-shot comparator control.

RES0, [30:3]

RES0 Reserved

DV, [2]

Data value comparator support:

- | | |
|---|--|
| 0 | Single-shot data value comparisons not supported |
|---|--|

DA, [1]

Data address comparator support:

- | | |
|---|--|
| 0 | Single-shot data address comparisons not supported |
|---|--|

INST, [0]

Instruction address comparator support:

- | | |
|---|---|
| 1 | Single-shot instruction address comparisons supported |
|---|---|

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Embedded Trace Macrocell Architecture Specification ETMv4](#) .

The TRCSSCSR0 can be accessed through the external debug interface, offset 0x2A0.

5.10.68 TRCSTATR, Status Register

The TRCSTATR indicates the ETM trace unit status.

Bit field descriptions

The TRCSTATR is a 32-bit register.

Figure 5-125: TRCSTATR bit assignments

RES0, [31:2]

- | | |
|------|----------|
| RES0 | Reserved |
|------|----------|

PMSTABLE, [1]

Indicates whether the ETM trace unit registers are stable and can be read:

- | | |
|---|--------------------------------------|
| 0 | The programmers model is not stable. |
| 1 | The programmers model is stable. |

IDLE, [0]

Idle status:

- | | |
|---|---------------------------------|
| 0 | The ETM trace unit is not idle. |
| 1 | The ETM trace unit is idle. |

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Embedded Trace Macrocell Architecture Specification ETMv4](#) .

The TRCSTATR can be accessed through the external debug interface, offset 0x00C.

5.10.69 TRCSYNCP, Synchronization Period Register

The TRCSYNCP controls how often periodic trace synchronization requests occur.

Bit field descriptions

The TRCSYNCP is a 32-bit register.

Figure 5-126: TRCSYNCP bit assignments

RES0, [31:5]

RES0 Reserved

PERIOD, [4:0]

Defines the number of bytes of trace between synchronization requests as a total of the number of bytes generated by both the instruction and data streams. The number of bytes is 2^N where N is the value of this field:

- A value of zero disables these periodic synchronization requests, but does not disable other synchronization requests.
- The minimum value that can be programmed, other than zero, is 8, providing a minimum synchronization period of 256 bytes.
- The maximum value is 20, providing a maximum synchronization period of 2^{20} bytes.

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Embedded Trace Macrocell Architecture Specification ETMv4](#).

The TRCSYNCP can be accessed through the external debug interface, offset 0x034.

5.10.70 TRCTRACEIDR, Trace ID Register

The TRCTRACEIDR sets the trace ID for instruction trace.

Bit field descriptions

The TRCTRACEIDR is a 32-bit register.

Figure 5-127: TRCTRACEIDR bit Assignments**RES0, [31:7]**

RES0 Reserved

TRACEID, [6:0]

Trace ID value. When only instruction tracing is enabled, this provides the trace ID.

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Embedded Trace Macrocell Architecture Specification ETMv4](#).

The TRCTRACEIDR can be accessed through the external debug interface, offset 0x040.

5.10.71 TRCTSCTLR, Global Timestamp Control Register

The TRCTSCTLR controls the insertion of global timestamps in the trace streams. When the selected event is triggered, the trace unit inserts a global timestamp into the trace streams. The event is selected from one of the Resource Selectors.

Bit field descriptions

The TRCTSCTLR is a 32-bit register.

Figure 5-128: TRCTSCTLR bit assignments**RES0, [31:8]**

RES0 Reserved

TYPE, [7]

Single or combined resource selector

RES0, [6:4]

RES0 Reserved

SEL, [3:0]

Identifies the resource selector to use

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Embedded Trace Macrocell Architecture Specification ETMv4](#) .

The TRCTSCTLR can be accessed through the external debug interface, offset 0x030.

5.10.72 TRCVICTLR, ViewInst Main Control Register

The TRCVICTLR controls instruction trace filtering.

Bit field descriptions

The TRCVICTLR is a 32-bit register.

Figure 5-129: TRCVICTLR bit assignments

RES0, [31:24]

RES0 Reserved

EXLEVEL_NS, [23:20]

In Non-secure state, each bit controls whether instruction tracing is enabled for the corresponding Exception level:

- | | |
|---|---|
| 0 | Trace unit generates instruction trace, in Non-secure state, for Exception level <i>n</i> . |
| 1 | Trace unit does not generate instruction trace, in Non-secure state, for Exception level <i>n</i> . |

The Exception levels are:

- | | |
|---------|-------------------|
| Bit[20] | Exception level 0 |
| Bit[21] | Exception level 1 |

Bit[22]	Exception level 2
Bit[23]	RAZ/WI. Instruction tracing is not implemented for Exception level 3.

EXLEVEL_S, [19:16]

In Secure state, each bit controls whether instruction tracing is enabled for the corresponding Exception level:

0	Trace unit generates instruction trace, in Secure state, for Exception level <i>n</i> .
1	Trace unit does not generate instruction trace, in Secure state, for Exception level <i>n</i> .

The Exception levels are:

Bit[16]	Exception level 0
Bit[17]	Exception level 1
Bit[18]	RAZ/WI. Instruction tracing is not implemented for Exception level 2.
Bit[19]	Exception level 3

RES0, [15:12]

RES0	Reserved
-------------	----------

TRCERR, [11]

Selects whether a system error exception must always be traced:

0	System error exception is traced only if the instruction or exception immediately before the system error exception is traced.
1	System error exception is always traced regardless of the value of ViewInst.

TRCRESET, [10]

Selects whether a reset exception must always be traced:

0	Reset exception is traced only if the instruction or exception immediately before the reset exception is traced.
1	Reset exception is always traced regardless of the value of ViewInst.

SSSTATUS, [9]

Indicates the current status of the start/stop logic:

0	Start/stop logic is in the stopped state.
1	Start/stop logic is in the started state.

RES0, [8]

RES0	Reserved
-------------	----------

TYPE, [7]

Selects the resource type for the viewinst event:

0	Single selected resource
1	Boolean combined resource pair

RES0, [6:4]

RES0	Reserved
------	----------

SEL, [3:0]

Selects the resource number to use for the viewinst event, based on the value of TYPE:

When TYPE is 0, selects a single selected resource from 0-15 defined by bits[3:0].

When TYPE is 1, selects a Boolean combined resource pair from 0-7 defined by bits[2:0].

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Embedded Trace Macrocell Architecture Specification ETMv4](#) .

The TRCVICTLR can be accessed through the external debug interface, offset 0x080.

5.10.73 TRCVIIECTLR, ViewInst Include-Exclude Control Register

The TRCVIIECTLR defines the address range comparators that control the ViewInst Include/Exclude control.

Bit field descriptions

The TRCVIIECTLR is a 32-bit register.

Figure 5-130: TRCVIIECTLR bit assignments

RES0, [31:20]

RES0	Reserved
------	----------

EXCLUDE, [19:16]

Defines the address range comparators for ViewInst exclude control. One bit is provided for each implemented Address Range Comparator.

RES0, [15:4]

RES0 Reserved

INCLUDE, [3:0]

Defines the address range comparators for ViewInst include control.

Selecting no include comparators indicates that all instructions must be included. The exclude control indicates which ranges must be excluded.

One bit is provided for each implemented Address Range Comparator.

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Embedded Trace Macrocell Architecture Specification ETMv4](#) .

The TRCVIIECTLR can be accessed through the external debug interface, offset 0x084.

5.10.74 TRCVISSCTLR, ViewInst Start-Stop Control Register

The TRCVISSCTLR defines the single address comparators that control the ViewInst Start/Stop logic.

Bit field descriptions

The TRCVISSCTLR is a 32-bit register.

Figure 5-131: TRCVISSCTLR bit assignments

RES0, [31:24]

RES0 Reserved

STOP, [23:16]

Defines the single address comparators to stop trace with the ViewInst Start/Stop control.

One bit is provided for each implemented single address comparator.

RES0, [15:8]

RES0 Reserved

START, [7:0]

Defines the single address comparators to start trace with the ViewInst Start/Stop control.

One bit is provided for each implemented single address comparator.

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Embedded Trace Macrocell Architecture Specification ETMv4](#) .

The TRCVISSCTLR can be accessed through the external debug interface, offset 0x088.

5.10.75 TRCVMIDCVR0, VMID Comparator Value Register 0

The TRCVMIDCVR0 contains a VMID value.

Bit field descriptions

Figure 5-132: TRCVMIDCVR0 bit assignments

RES0, [63:32]

RES0 Reserved

VALUE, [31:0]

The VMID value

The TRCVMIDCVR0 can be accessed through the internal memory-mapped interface and the external debug interface, offset 0x640.

Usage constraints

Accepts writes only when the trace unit is disabled.

Configurations

Available in all configurations.

5.10.76 TRCVMIDCCTLRO, Virtual context identifier Comparator Control Register 0

The TRCVMIDCCTLRO contains the Virtual machine identifier mask value for the TRCVMIDCVR0 register.

Bit field descriptions

The TRCVMIDCCTLRO is a 32-bit register.

Figure 5-133: TRCVMIDCCTLRO bit assignments

RES0, [31:4]

RES0 Reserved

COMP0, [3:0]

Controls the mask value that the trace unit applies to TRCVMIDCVR0. Each bit in this field corresponds to a byte in TRCVMIDCVR0. When a bit is:

- | | |
|----------|--|
| 0 | The trace unit includes the relevant byte in TRCVMIDCVR0 when it performs the Virtual context ID comparison. |
| 1 | The trace unit ignores the relevant byte in TRCVMIDCVR0 when it performs the Virtual context ID comparison. |

Bit fields and details not provided in this description are architecturally defined. See the [Arm® Embedded Trace Macrocell Architecture Specification ETMv4](#).

The TRCVMIDCCTLRO can be accessed through the external debug interface, offset 0x688.

5.11 SPE registers

This chapter describes the *Statistical Profiling Extension* (SPE) registers.

5.11.1 SPE register summary

This section summarizes the *Statistical Profiling Extension* (SPE) registers.

The following table lists all of the SPE registers included in the SPE architecture.

Table 5-42: AArch64 SPE register summary

Op0	Op1	CRn	CRm	Op2	Name	Type	Reset	Description
3	0	c9	c9	0	PMSCR_EL1	RW	UNK	Statistical Profiling Control Register EL1
3	4	c9	c9	0	PMSCR_EL2	RW	UNK	Statistical Profiling Control Register EL2

Appendix A Core AArch32 UNPREDICTABLE behaviors

This appendix describes the cases in which the Cortex®-A78AE core implementation diverges from the preferred behavior described in Armv8 AArch32 **UNPREDICTABLE** behaviors.

A.1 Use of R15 by Instruction

If the use of R15 as a base register for a load or store is **UNPREDICTABLE**, the value used by the load or store using R15 as a base register is the *Program Counter* (PC) with its usual offset and, in the case of T32 instructions, with the forced word alignment. In this case, if the instruction specifies Writeback, then the load or store is performed without Writeback.

The Cortex®-A78AE core does not implement a *Read 0* or *Ignore Write* policy on **UNPREDICTABLE** use of R15 by instruction. Instead, the Cortex®-A78AE core takes an **UNDEFINED** exception trap.

A.2 Load/Store accesses crossing page boundaries

The Cortex®-A78AE core implements a set of behaviors for load or store accesses that cross page boundaries.

Crossing a page boundary with different memory types or shareability attributes

The [Arm® Architecture Reference Manual for A-profile architecture](#), states that a memory access from a load or store instruction that crosses a page boundary to a memory location that has a different memory type or shareability attribute results in **CONSTRAINED UNPREDICTABLE** behavior.

Crossing a 4KB boundary with a Device access

The [Arm® Architecture Reference Manual for A-profile architecture](#), states that a memory access from a load or store instruction to Device memory that crosses a 4KB boundary results in **CONSTRAINED UNPREDICTABLE** behavior.

Implementation (for both page boundary specifications)

For an access that crosses a page boundary, the Cortex®-A78AE core implements the following behaviors:

- Store crossing a page boundary:
 - No alignment fault.
 - The access is split into two stores.
 - Each store uses the memory type and shareability attributes associated with its own address.
- Load crossing a page boundary (Device to Device and Normal to Normal):

- No alignment fault.
- The access is split into two loads.
- Each load uses the memory type and shareability attributes associated with its own address.
- Load crossing a page boundary (Device to Normal and Normal to Device):
 - The instruction will generate an alignment fault.

A.3 Armv8 Debug UNPREDICTABLE behaviors

This section describes the behavior that the Cortex®-A78AE core implements when:

- A topic has multiple options.
- The behavior differs from either or both of the Options and Preferences behaviors.

This section does not describe the behavior when a topic only has a single option and the core implements the preferred behavior.

Table A-1: Armv8 Debug UNPREDICTABLE behaviors

Scenario	Behavior
A32 BKPT instruction with condition code not AL	The core implements the following preferred option: <ul style="list-style-type: none"> • Executed unconditionally.
Address match breakpoint match only on second halfword of an instruction	The core generates a breakpoint on the instruction if CPSR.IL=0. In the case of CPSR.IL=1, the core does not generate a breakpoint exception.
Address matching breakpoint on A32 instruction with DBGBCRn.BAS=1100	The core implements the following option: <ul style="list-style-type: none"> • Does match if CPSR.IL=0.
Address match breakpoint match on T32 instruction at DBGBCRn+2 with DBGBCRn.BAS=1111	The core implements the following option: <ul style="list-style-type: none"> • Does match.
Link to non-existent breakpoint or breakpoint that is not context-aware	The core implements the following option: <ul style="list-style-type: none"> • No Breakpoint or Watchpoint debug event is generated, and the LBN field of the <i>linker</i> reads UNKNOWN.
DBGWCRn_EL1.MASK!=00000 and DBGWCRn_EL1.BAS!=11111111	The core behaves as indicated in the sole Preference: <ul style="list-style-type: none"> • DBGWCRn_EL1.BAS is IGNORED and treated as if 0x11111111.
Address match breakpoint with DBGBCRn_EL1.BAS=0000	The core implements the following option: <ul style="list-style-type: none"> • As if disabled.
DBGWCRn_EL1.BAS specifies a non-contiguous set of bytes within a double-word	The core implements the following option: <ul style="list-style-type: none"> • A Watchpoint debug event is generated for each byte.
A32 HLT instruction with condition code not AL	The core implements the following option: <ul style="list-style-type: none"> • Executed unconditionally.

Scenario	Behavior
Execute instruction at a given EL when the corresponding EDECCR bit is 1 and Halting is allowed	The core behaves as follows: <ul style="list-style-type: none"> Generates debug event and Halt no later than the instruction following the next <i>Context Synchronization operation</i> (CSO) excluding ISB instruction.
$H > N$ or $H = 0$ at Non-secure EL1 and EL0, including value read from PMCR_ELO.N	The core implements: <ul style="list-style-type: none"> A simple implementation where all of HPMN[4:0] are implemented, and In Non-secure EL1 and EL0: <ul style="list-style-type: none"> If $H > N$ then $M = N$. If $H = 0$ then $M = 0$.
$H > N$ or $H = 0$: value read back in MDCR_EL2.HPMN	The core implements: <ul style="list-style-type: none"> A simple implementation where all of HPMN[4:0] are implemented and for reads of MDCR_EL2.HPMN, return H.
$P \geq M$ and $P \neq 31$: reads and writes of PM XEVTYPER_ELO and PMXEVCNTR_ELO	The core implements: <ul style="list-style-type: none"> A simple implementation where all of SEL[4:0] are implemented, and if $P \geq M$ and $P \neq 31$ then the register is RESO.
$P \geq M$ and $P \neq 31$: value read in PMSELR_ELO.SEL	The core implements: <ul style="list-style-type: none"> A simple implementation where all of SEL[4:0] are implemented, and if $P \geq M$ and $P \neq 31$ then the register is RESO.
$P = 31$: reads and writes of PMXEVCNTR_ELO	The core implements: <ul style="list-style-type: none"> RESO.
$n \geq M$: Direct access to PMEVCNTRn_ELO and PMEVTYPERn_ELO	The core implements: <ul style="list-style-type: none"> If $n \geq N$, then the instruction is UNALLOCATED. Otherwise if $n \geq M$, then the register is RESO.
Exiting Debug state while instruction issued through EDITR is in flight	The core implements the following option: <ul style="list-style-type: none"> The instruction completes in Debug state before executing the restart.
Using memory-access mode with a non-word-aligned address	The core behaves as indicated in the sole Preference: <ul style="list-style-type: none"> Does unaligned accesses, faulting if these are not permitted for the memory type.
Access to memory-mapped registers mapped to Normal memory	The core behaves as indicated in the sole Preference: <ul style="list-style-type: none"> The access is generated, and accesses might be repeated, gathered, split or resized, in accordance with the rules for Normal memory, meaning the effect is UNPREDICTABLE.
Not word-sized accesses or (AArch64 only) doubleword-sized accesses >	The core behaves as indicated in the sole Preference: <ul style="list-style-type: none"> Reads occur and return UNKNOWN data. Writes set the accessed register(s) to UNKNOWN.
External debug write to register that is being reset	The core behaves as indicated in the sole Preference: <ul style="list-style-type: none"> Takes reset value.

Scenario	Behavior
Accessing reserved debug registers	<p>The core deviates from preferred behavior because the hardware cost to decode some of these addresses in debug power domain is significantly high.</p> <p>The actual behavior is:</p> <ol style="list-style-type: none"> For reserved debug registers in the address range 0x000-0xCFC and Performance Monitors registers in the address range 0x000, the response is either CONSTRAINED UNPREDICTABLE Error or RES0 when any of the following errors occurs: <ul style="list-style-type: none"> Off <p>The Core power domain is either completely off or in a low-power state where the Core power domain registers cannot be accessed.</p> DLK <p><code>DoubleLockStatus()</code> is TRUE and OS double-lock is locked (EDPRSR.DLK is 1).</p> OSLK <p>OS lock is locked (OSLSR_EL1.OSLK is 1).</p> For reserved debug registers in the address ranges 0x400-0x4FC and 0x800-0x8FC, the response is CONSTRAINED UNPREDICTABLE Error or RES0 when the conditions in 1 on page 542 do not apply and the following error occurs: <ul style="list-style-type: none"> EDAD <p><code>AllowExternalDebugAccess()</code> is FALSE. External debug access is disabled.</p> For reserved Performance Monitor registers in the address ranges 0x000-0x0FC and 0x400-0x47C, the response is either CONSTRAINED UNPREDICTABLE Error, or RES0 when the conditions in 1 on page 542 and 2 on page 542 do not apply, and the following error occurs: <ul style="list-style-type: none"> EPMAD <p><code>AllowExternalPMUAccess()</code> is FALSE. External Performance Monitors access is disabled.</p>
Clearing the <i>clear-after-read</i> EDPRSR bits when the Core power domain is on, and <code>DoubleLockStatus()</code> is TRUE	<p>The core behaves as indicated in the sole Preference:</p> <ul style="list-style-type: none"> Bits are not cleared to zero.

A.4 Other UNPREDICTABLE behaviors

This section describes other **UNPREDICTABLE** behaviors.

Table A-2: Other UNPREDICTABLE behaviors

Scenario	Description
CSSELR indicates a cache that is not implemented.	<p>If CSSELR indicates a cache that is not implemented, then on a read of the CCSIDR the behavior is CONSTRAINED UNPREDICTABLE, and can be one of the following:</p> <ul style="list-style-type: none"> The CCSIDR read is treated as NOP. The CCSIDR read is UNDEFINED. The CCSIDR read returns an UNKNOWN value (preferred).

Scenario	Description
HDCR.HPMN is set to 0, or to a value larger than PMCR.N.	<p>If HDCR.HPMN is set to 0, or to a value larger than PMCR.N, then the behavior in Non-secure EL0 and EL1 is CONSTRAINED UNPREDICTABLE, and one of the following must happen:</p> <ul style="list-style-type: none"> The number of counters accessible is an UNKNOWN non-zero value less than PMCR.N. There is no access to any counters. <p>For reads of HDCR.HPMN by EL2 or higher, if this field is set to 0 or to a value larger than PMCR.N, the core must return a CONSTRAINED UNPREDICTABLE value that is one of:</p> <ul style="list-style-type: none"> PMCR.N. The value that was written to HDCR.HPMN. (The value that was written to HDCR.HPMN) modulo 2h, where h is the smallest number of bits required for a value in the range 0 to PMCR.N.
CRC32 or CRC32C instruction with <code>size==64</code> .	On read of the instruction, the behavior is CONSTRAINED UNPREDICTABLE , and the instruction executes with the additional decode: <code>size==32</code> .
CRC32 or CRC32C instruction with <code>cond!=1110</code> in the A1 encoding.	<p>The core implements the following option:</p> <ul style="list-style-type: none"> Executed unconditionally.

First Confidential development release for r0p0	-

Table B-2: Differences between issue 0000-01 and 0000-02

Change	Location
Second Confidential development release for r0p0	-
Fixed typographical and grammatical errors.	Throughout document
Updated Features list	2.1.2 Features on page 24
Added information for Cache line lockout.	2.8.8 Cache-line lockout on page 85
Added information for Mixed-mode.	2.11.1 Implementing Split-Lock on page 88
Updated register ACTLR_EL2.	3.2.6 ACTLR_EL2, Auxiliary Control Register, EL2 on page 111
Updated register ACTLR_EL3.	3.2.7 ACTLR_EL3, Auxiliary Control Register, EL3 on page 113
Added Armv8.3 registers.	3.2.18 APDAKeyHi_EL1, Pointer Authentication Key A for Data on page 124
	3.2.19 APDAKeyLo_EL1, Pointer Authentication Key A for Data on page 125
	3.2.20 APDBKeyHi_EL1, Pointer Authentication Key B for Data on page 126
	3.2.21 APDBKeyLo_EL1, Pointer Authentication Key B for Data on page 127
	3.2.22 APGAKeyHi_EL1, Pointer Authentication Key A for Code on page 129
	3.2.23 APGAKeyLo_EL1, Pointer Authentication Key A for Code on page 130
	3.2.24 APIAKeyHi_EL1, Pointer Authentication Key A for Instruction on page 131
	3.2.25 APIAKeyLo_EL1, Pointer Authentication Key A for Instruction on page 132
	3.2.26 APIBKeyHi_EL1, Pointer Authentication Key B for Instruction on page 134
	3.2.27 APIBKeyLo_EL1, Pointer Authentication Key B for Instruction on page 135

Change	Location
Added register description for CPUACTLR5_EL1.	3.2.41 CPUACTLR5_EL1, CPU Auxiliary Control Register 5, EL1 on page 156
Added register description for CPUACTLR6_EL1.	3.2.42 CPUACTLR6_EL1, CPU Auxiliary Control Register 6, EL1 on page 157
Added Cache line lockout registers.	3.2.43 CPUCLLCTLR_EL1, Cache Line Lockout Control Register, EL1 on page 159 3.2.44 CPUCLL0_EL1, CPU Cache Line Lockout Register, EL1 on page 160 3.2.45 CPUCLL1_EL1, CPU Cache Line Lockout Register, EL1 on page 161
Updated Instruction Register 0, Physical Address row with additional information.	2.6.6.4 Encoding for the L2 TLB on page 75
Provided additional information for error injection.	2.8.7 Error injection on page 84
Corrected behavior of ACTLR_EL2.TAM bit.	3.2.6 ACTLR_EL2, Auxiliary Control Register, EL2 on page 111
Corrected CCSIDR encodings.	3.2.33 CCSIDR_EL1, Cache Size ID Register, EL1 on page 145
Updated CPUECTLR_EL1 register definition.	3.2.47 CPUECTLR_EL1, CPU Extended Control Register, EL1 on page 164
Corrected ID_AA64DFR0_EL1 register definition.	3.2.80 ID_AA64DFR0_EL1, AArch64 Debug Feature Register 0, EL1 on page 209
Updated ID_AA64ISAR1_EL1 register.	3.2.83 ID_AA64ISAR1_EL1, AArch64 Instruction Set Attribute Register 1, EL1 on page 213
Updated MDCR_EL3 register.	3.2.109 MDCR_EL3, Monitor Debug Configuration Register, EL3 on page 254
Updated register SCTLR_EL1	3.2.116 SCTLR_EL1, System Control Register, EL1 on page 263
Updated register SCTLR_EL2	3.2.117 SCTLR_EL2, System Control Register, EL2 on page 266
Updated register SCTLR_EL3	3.2.118 SCTLR_EL3, System Control Register, EL3 on page 270
Updated register TCR_EL3	3.2.121 TCR_EL3, Translation Control Register, EL3 on page 275
Updated register ERR0MISC0	3.3.5 ERR0MISC0, Error Record Miscellaneous Register 0 on page 291
Corrected PMCR and PMCR_ELO register definitions.	5.4.5 PMCR, Performance Monitors Control Register on page 401 5.5.4 PMCR_ELO, Performance Monitors Control Register, ELO on page 412
Updated PMCEID1_ELO reset value	5.5.3 PMCEID1_ELO, Performance Monitors Common Event Identification Register 1, ELO on page 409

Change	Location
Corrected trace integration control register list.	5.10.42 TRCITATBCTR0, Trace Integration Test ATB Control Register 0 on page 507 5.10.43 TRCITATBCTR1, Trace Integration Test ATB Control Register 1 on page 508 5.10.44 TRCITATBCTR2, Trace Integration Test ATB Control Register 2 on page 508 5.10.45 TRCITATBDATA0, Trace Integration Test ATB Data Register 0 on page 509 5.10.46 TRCITCTRL, Trace Integration Mode Control register on page 510 5.10.47 TRCITMISCIN, Trace Integration Miscellaneous Input Register on page 511 5.10.48 TRCITMISCOUT, Trace Integration Miscellaneous Outputs Register on page 512
Removed TRCSTALLCTLR register definition.	-

Table B-3: Differences between issue 0000-02 and 0000-03

Change	Location
First Confidential early access release for rOp0	-
Fixed typographical and grammatical errors.	Throughout document
Added paragraph and table in L2 memory system.	2.2.1.7 L2 memory system on page 32
Added footnote for L2 TLB.	2.6.6.4 Encoding for the L2 TLB on page 75
Expanded on Cache-line lockout.	2.8.8 Cache-line lockout on page 85
Corrected AArch64 registers reset values.	3.2.4 AArch64 registers by functional group on page 104
Removed register descriptions in CPUCLLO_EL1 and CPUCLL1_EL1. These register descriptions are in ERRORMISCO.	3.2.44 CPUCLLO_EL1, CPU Cache Line Lockout Register, EL1 on page 160 and 3.2.45 CPUCLL1_EL1, CPU Cache Line Lockout Register, EL1 on page 161
Updated CPUECTLR_EL1 to include RAS_RAZ bit.	3.2.47 CPUECTLR_EL1, CPU Extended Control Register, EL1 on page 164
Corrected errors in the ID_AA64ISAR1_EL1 register.	3.2.83 ID_AA64ISAR1_EL1, AArch64 Instruction Set Attribute Register 1, EL1 on page 213
Updated the ERRORMISCO register.	3.3.5 ERRORMISCO, Error Record Miscellaneous Register 0 on page 291

Table B-4: Differences between issue 0000-03 and 0001-04

Change	Location
First Confidential early access release for rOp1	-
Fixed typographical and grammatical errors.	Throughout document
Added CPUPPMCR_EL3 register definition.	3.2.55 CPUPPMCR_EL3, CPU Power Performance Management Configuration Register, EL3 on page 184
Clarified split, lock, and hybrid mode operation and configurations.	2.1.1 About the core on page 22
Corrected L1 data TLB description.	2.2.1.6 L1 data memory system on page 31

Change	Location
Updated ID registers for r0p1.	Throughout document
Added usage constraints to CPUCLLO_EL1 and CPUCLL1_EL1.	3.2.44 CPUCLLO_EL1, CPU Cache Line Lockout Register, EL1 on page 160 3.2.45 CPUCLL1_EL1, CPU Cache Line Lockout Register, EL1 on page 161
Corrected reset value for TRCIDR3.	5.10.1 ETM register summary on page 465 3.2.45 CPUCLL1_EL1, CPU Cache Line Lockout Register, EL1 on page 161

Table B-5: Differences between 0001-04 and 0001-05

Change	Location
Second Non-Confidential early access release for r0p1	-
Editorial changes	Throughout document.
Updated product name to Cortex®-A78AE	Throughout document.
Corrected GIC version support to include GICv3 and GICv4.	2.1.5 Supported standards and specifications on page 27

Table B-6: Differences between 0001-05 and 0001-06

Change	Location
Third Non-Confidential early access release for r0p1	-
Editorial changes	Throughout document.
Updated terminology for multi-OS support	Throughout document.
Updated ID_AA64ISAR_EL1 register	3.2.83 ID_AA64ISAR1_EL1, AArch64 Instruction Set Attribute Register 1, EL1 on page 213
Updated L1 data cache data format for data register 2	2.6.6.2 Encoding for L1 data cache tag, L1 data cache data, and L1 TLB data on page 68

Table B-7: Differences between 0001-06 and 0002-07

Change	Location
First Non-Confidential release for r0p2.	-
Editorial changes.	Throughout document.
Updated MMU configuration description.	2.5.5.1 Configuring MMU accesses on page 50
Added Conflict aborts.	2.5.6.3 Conflict aborts on page 52
Updated text.	2.6.6 Direct access to internal memory on page 62
Updated text.	2.8.1 Cache ECC and parity on page 78
Updated table 2-70.	2.8.2 Cache protection behavior on page 79
Removed IFSR32_EL2 register from table 3-2.	3.2.2 AArch64 architectural system register summary on page 96
Removed DACR32_EL2 SDER32_EL3 and FPEXC32_EL2 registers from table 3-3.	3.2.2 AArch64 architectural system register summary on page 96
Updated reset value for MIDR_EL1 in table 3-6.	3.2.4 AArch64 registers by functional group on page 104
Updated ACTLR_EL2 register bit assignment.	3.2.6 ACTLR_EL2, Auxiliary Control Register, EL2 on page 111
Updated ACTR_EL2 register bit assignment.	3.2.29 ATCR_EL2, Auxiliary Translation Control Register, EL2 on page 139
Updated ACTR_EL3 register bit assignment.	3.2.31 ATCR_EL3, Auxiliary Translation Control Register, EL3 on page 142

Change	Location
Updated ACTR_EL2 register bit assignment.	3.2.29 ACTR_EL2, Auxiliary Translation Control Register, EL2 on page 139
Updated CLIDR_EL1 register bit assignment.	3.2.34 CLIDR_EL1, Cache Level ID Register, EL1 on page 147
Updated table 3-58.	3.2.44 CPUCLLO_EL1, CPU Cache Line Lockout Register, EL1 on page 160
Updated table 3-59.	3.2.45 CPUCLL1_EL1, CPU Cache Line Lockout Register, EL1 on page 161
Updated CPUPWRCTLR_EL1, Power Control Register, EL1.	3.2.57 CPUPWRCTLR_EL1, Power Control Register, EL1 on page 186
Note added.	3.2.86 ID_AA64MMFR2_EL1, AArch64 Memory Model Feature Register 2, EL1 on page 217
Note added.	3.3.10 ERR0STATUS, Error Record Primary Status Register on page 305
Updated text.	4.2.1 About the PMU on page 353
Updated PMCR_ELO reset value.	5.2.1 AArch64 Debug register summary on page 373
Updated CPUPMMIR_EL1 register description.	5.5.5 CPUPMMIR_EL1, Performance Monitors Machine Identification Register, EL1 on page 415
Updated table 5-13.	5.6.1 Memory-mapped PMU register summary on page 416
Updated PMMIR register description.	5.6.7 PMMIR, Performance Monitors Machine Identification Register , on page 423
Updated table 5-41.	5.10.1 ETM register summary on page 465
Updated table 5-42.	5.11.1 SPE register summary on page 537

Table B-8: Differences between 0002-07 and 0003-08

Change	Location
First Non-Confidential release for r0p3	-
Editorial changes	Throughout document.
Added sentence.	2.5.6.3 Conflict aborts on page 52
Added information about AArch32 operations.	2.6.2.4 Data cache maintenance considerations on page 56
Added bullet point to note	2.8.7 Error injection on page 84
Added new note	2.8.7 Error injection on page 84
Updated register bit field information and diagrams	3.1 AArch32 system registers on page 95
Updated register occurrence in table	3.2.2 AArch64 architectural system register summary on page 96
Updated instruction trace cycle counting value in table	4.4.2 ETM trace unit generation options and resources on page 365
Updated CTI and PMU values in table	4.4.2 ETM trace unit generation options and resources on page 365
Updated information about L2 unified cache	2.6.6.3 ZH5 Encoding for the L2 unified cache on page 71
Updated image and bit descriptions for register	3.2.83 ID_AA64ISAR1_EL1, AArch64 Instruction Set Attribute Register 1, EL1 on page 213
Updated reset value for register	5.11.1 SPE register summary on page 537
Updated reset value for MIDR_EL1 register	3.2.4 AArch64 registers by functional group on page 104
