Arm® SSE-123 Example Subsystem Technical Reference Manual

Preface

About this book	7
Feedback	10

Chapter 1

Introduction

1.1	About the SSE-123 Example Subsystem	1-12
1.2	About IoT System on Chip implementations	1-13
1.3	Compliance	1-14
1.4	Features of SSE-123	1-15
1.5	Configurable options	1-16
1.6	Product documentation	1-18
1.7	Product revisions	1-19

Chapter 2

Functional description

2.1	Clocks	2-21
2.2	Resets	2-24
2.3	Power management	2-28
2.4	Central processor	2-31
2.5	Interconnect	2-33
2.6	Debug	2-34
2.7	Security control	2-36
2.8	Peripherals	2-38

	2.9	Subsystem SRAM	2-39
Chapter 3		Programmers model	
	3.1	About the programmers model	3-41
	3.2	Subsystem memory map	3-42
	3.3	Subsystem register descriptions	3-46
	3.4	Subsystem interrupt map	3-83
Appendix A		Signal descriptions	
	A.1	Clock signals	Appx-A-85
	A.2	Reset signals	Appx-A-86
	A.3	Clock control interface signals	Appx-A-87
	A.4	HCLK clock Q-Channel signals	Appx-A-88
	A.5	DCLK clock Q-Channel signals	Appx-A-89
	A.6	Entry delay signals	Appx-A-90
	A.7	Clock enable signals	Appx-A-91
	A.8	Reset control interface signals	Appx-A-92

Preface

This preface introduces the *Arm® SSE-123 Example Subsystem Technical Reference Manual*.

It contains the following:

- [About this book](#) on page 7.
- [Feedback](#) on page 10.

About this book

This book is for the Arm® SSE-123 Example Subsystem.

Product revision status

The *rm**pn* identifier indicates the revision status of the product described in this book, for example, r1p2, where:

rm Identifies the major revision of the product, for example, r1.

pn Identifies the minor revision or modification status of the product, for example, p2.

Intended audience

This book is written for system designers, system integrators, and programmers who are designing or programming a *System-on-Chip* (SoC) that uses the SSE-123.

Using this book

This book is organized into the following chapters:

Chapter 1 Introduction

This chapter provides an overview of the SSE-123 Example Subsystem.

Chapter 2 Functional description

This chapter describes the functionality of the SSE-123 Example Subsystem.

Chapter 3 Programmers model

This chapter describes the programmers model for the SSE-123 Example Subsystem.

Appendix A Signal descriptions

This appendix describes the SSE-123 Example Subsystem external signals.

Appendix B System time components

This appendix describes the SSE-123 Example Subsystem system time components.

Appendix C Revisions

This appendix describes the technical changes between released issues of this book.

Glossary

The Arm® Glossary is a list of terms used in Arm documentation, together with definitions for those terms. The Arm Glossary does not contain terms that are industry standard unless the Arm meaning differs from the generally accepted meaning.

See the *Arm® Glossary* for more information.

Typographic conventions

italic

Introduces special terminology, denotes cross-references, and citations.

bold

Highlights interface elements, such as menu names. Denotes signal names. Also used for terms in descriptive lists, where appropriate.

`monospace`

Denotes text that you can enter at the keyboard, such as commands, file and program names, and source code.

monospace

Denotes a permitted abbreviation for a command or option. You can enter the underlined text instead of the full command or option name.

monospace italic

Denotes arguments to monospace text where the argument is to be replaced by a specific value.

monospace bold

Denotes language keywords when used outside example code.

<and>

Encloses replaceable terms for assembler syntax where they appear in code or code fragments.
For example:

```
MRC p15, 0, <Rd>, <CRn>, <CRm>, <Opcode_2>
```

SMALL CAPITALS

Used in body text for a few terms that have specific technical meanings, that are defined in the *Arm® Glossary*. For example, IMPLEMENTATION DEFINED, IMPLEMENTATION SPECIFIC, UNKNOWN, and UNPREDICTABLE.

Timing diagrams

The following figure explains the components used in timing diagrams. Variations, when they occur, have clear labels. You must not assume any timing information that is not explicit in the diagrams.

Shaded bus and signal areas are undefined, so the bus or signal can assume any value within the shaded area at that time. The actual level is unimportant and does not affect normal operation.

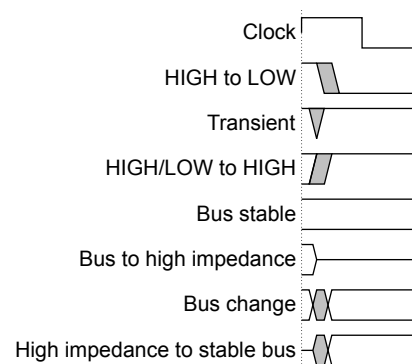

Figure 1 Key to timing diagram conventions

Signals

The signal conventions are:

Signal level

The level of an asserted signal depends on whether the signal is active-HIGH or active-LOW.
Asserted means:

- HIGH for active-HIGH signals.
- LOW for active-LOW signals.

Lowercase n

At the start or end of a signal name denotes an active-LOW signal.

Feedback

Feedback on this product

If you have any comments or suggestions about this product, contact your supplier and give:

- The product name.
- The product revision or version.
- An explanation with as much information as you can provide. Include symptoms and diagnostic procedures if appropriate.

Feedback on content

If you have comments on content then send an e-mail to errata@arm.com. Give:

- The title *Arm SSE-I23 Example Subsystem Technical Reference Manual*.
- The number 101370_0000_0000_en.
- If applicable, the page number(s) to which your comments refer.
- A concise explanation of your comments.

Arm also welcomes general suggestions for additions and improvements.

————— **Note** —————

Arm tests the PDF only in Adobe Acrobat and Acrobat Reader, and cannot guarantee the quality of the represented document when used with any other PDF reader.

Chapter 1

Introduction

This chapter provides an overview of the SSE-123 Example Subsystem.

It contains the following sections:

- [*1.1 About the SSE-123 Example Subsystem*](#) on page 1-12.
- [*1.2 About IoT System on Chip implementations*](#) on page 1-13.
- [*1.3 Compliance*](#) on page 1-14.
- [*1.4 Features of SSE-123*](#) on page 1-15.
- [*1.5 Configurable options*](#) on page 1-16.
- [*1.6 Product documentation*](#) on page 1-18.
- [*1.7 Product revisions*](#) on page 1-19.

1.1 About the SSE-123 Example Subsystem

The SSE-123 Example Subsystem integrates a subsystem of key Arm components that implement core functionality of a system targeting *Internet of Things (IoT) System on Chip (SoC)* designs.

The subsystem can be implemented as a standalone single core system or as part of a multiprocessor system.

The following figure shows a block diagram of the SSE-123 Example Subsystem.

Figure 1-1 SSE-123 Example Subsystem block diagram

The block diagram shows all the key integrated components and interfaces.

1.2 About IoT System on Chip implementations

The SSE-123 Example Subsystem must be extended to create an IoT SoC. A complete system typically contains the following components:

Compute subsystem

The compute subsystem consists of a single Cortex-M23 processor and associated bus, debug, controller, peripherals, and interface logic supplied by Arm.

Reference system memory and peripherals

SRAM is part of the SSE-123 Example Subsystem, but an SoC requires extra memory, control, and peripheral components beyond the minimum subsystem components. Flash memory, for example, is not provided with the SSE-123 Example Subsystem.

Communication interface

The endpoint must have some way of communicating with other nodes or masters in the system. This interface could be WiFi, Bluetooth, or a wired connection.

Sensor or control component

To be useful as an endpoint, the reference design is typically extended by adding sensors or control logic such as temperature input or motor control output.

Software development environment

Arm provides a complete software development environment which includes the Mbed™ operating system, Arm or GNU (GCC) compilers and debuggers, and firmware.

Custom peripherals typically require corresponding third-party firmware that can be integrated into the software stack.

This section contains the following subsection:

- [1.2.1 IoT hardware and software on page 1-13.](#)

1.2.1 IoT hardware and software

The following figure shows a block diagram of the hardware and software in an IoT system.

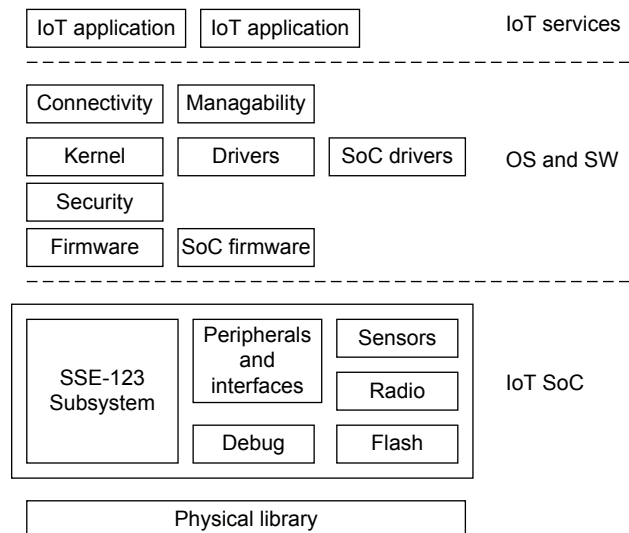

Figure 1-2 Hardware and software solution

1.3 Compliance

The SSE-123 Example Subsystem complies with, or implements, the specifications that this section describes. This document complements architecture reference manuals, architecture specifications, protocol specifications, and relevant external standards. It does not duplicate information from these sources.

This section contains the following subsections:

- [1.3.1 Arm architecture on page 1-14.](#)
- [1.3.2 Security architecture on page 1-14.](#)
- [1.3.3 Interrupt controller architecture on page 1-14.](#)
- [1.3.4 Advanced Microcontroller Bus Architecture \(AMBA®\) on page 1-14.](#)
- [1.3.5 Debug architecture on page 1-14.](#)
- [1.3.6 Power control architecture on page 1-14.](#)

1.3.1 Arm architecture

The Cortex-M23 processor in the subsystem implements the Armv8-M Baseline Architecture with Security Extension.

See the *Arm®v8-M Architecture Reference Manual*.

1.3.2 Security architecture

The SSE-123 is designed to facilitate implementation of a TBSA-M compliant system.

See the *Arm® Platform Security Architecture - Trusted Base System Architecture for Armv8-M*.

1.3.3 Interrupt controller architecture

The SSE-123 implements Arm *Nested Vector Interrupt Controller* (NVIC) and Arm *Wakeup Interrupt Controller* (WIC).

See the *Arm® Cortex®-M23 Processor Technical Reference Manual*.

1.3.4 Advanced Microcontroller Bus Architecture (AMBA®)

The SSE-123 implements the following interface protocol architectures:

- *Advanced High-Performance Bus 5* (AHB5). See the *AMBA® 5 AHB Protocol Specification*.
- *Advanced Peripheral Bus 4* (APB4). See the *AMBA® APB Protocol Specification Version: 2.0*.
- *Low-Power Interface* (LPI), Q-Channel, and- P-Channel. See the *AMBA® Low Power Interface Specification*.

1.3.5 Debug architecture

The SSE-123 implements the Arm *Debug Interface Architecture 5* (ADIv5)-compliant debug interfaces.

See the *Arm® Debug Interface Architecture Specification, ADIv5.0 to ADIv5.2*.

1.3.6 Power control architecture

The SSE-123 implements the framework for system power control that the Arm *Power Control System Architecture* (PCSA) Version 2.0 specification defines.

See the *Arm® Power Control System Architecture Specification Version 2.0*.

1.4 Features of SSE-123

The SSE-123 Example Subsystem provides the following features:

- A Cortex-M23 processor, including Armv8-M Security Extensions.
- A single bank of system SRAM.
- CoreLink SIE-200 System IP for Embedded:
 - AHB5 bus matrix.
 - *Memory Protection Controller* (MPC).
 - *Peripheral Protection Controller* (PPC).
 - AHB5 to APB4 bridge.
 - AHB5 to SRAM controller.
- CoreLink PCK-600 Power Control Kit:
 - *Power Policy Unit* (PPU).
 - Clock controller.
 - Low-Power Distributor Q-Channel (LPD-Q).
- *Implementation Defined Attribution Unit* (IDAU).
- Cortex-M23 processor *Wakeup Interrupt Controller* (WIC).
- System Timer and Watchdog.
- System Control and Security Control Registers.
- Optional Cortex-M23 processor Debug components:
 - *Embedded Trace Macrocell* (ETM).
 - *Cross Trigger Interface* (CTI).
 - Debug APB interconnect.

1.5 Configurable options

The SSE-123 Example Subsystem is highly configurable and provides configuration options for features of the design.

This section contains the following subsections:

- [1.5.1 Subsystem configuration options on page 1-16.](#)
- [1.5.2 Processor configuration options on page 1-16.](#)

1.5.1 Subsystem configuration options

This section defines the configuration options for the SSE-123 Example Subsystem.

The following table shows the subsystem configuration options.

Table 1-1 Subsystem configuration options

Feature	Configurable options
SRAM size	8KB to 16MB.
SRAM MPC block size	32 bytes to 1MB.
Debug support	Present or absent.
Debug trace	Present or absent. Debug support must also be present for debug trace.
Single-Cycle I/O port	Present or absent.
Memory retention power state	Present or absent.
Interrupts	0-224 expansion interrupt lines are present.
Wakeup interrupt sources	2-242 interrupt lines are used as wakeup sources: 2 Only <i>Non-Maskable Interrupt (NMI)</i> and RXEV are supported. 3-18 NMI , RXEV , and select internal interrupts are supported. 19-242 NMI , RXEV , internal interrupts and select expansion interrupts are supported.
Interrupt disables	Each expansion interrupt line can be independently enabled or disabled.
Interrupt latency	21-255 number of cycles between pending interrupt and vector fetch from the Cortex-M23 processor.
<i>Vector Table Offset Register (VTOR)</i> initial reset value	Address at reset for the Cortex-M23 processor VTOR_NS.
Security control expansion	Security control signals and security violation interrupts for the following expansion devices: 0-16 <i>Memory Protection Controller (MPC)</i> . 0-4 <i>AHB Peripheral Protection Controller (PPC)</i> with 0-16 peripherals. 0-4 <i>APB Peripheral Protection Controller (PPC)</i> with 0-64 peripherals. 0-16 <i>Master Security Controller (MSC)</i> . 0-16 Bridge error interrupts.
External bus access control	Blocking or not blocking.

1.5.2 Processor configuration options

The SSE-123 Example Subsystem supports a range of configurable options for the Cortex-M23 processor.

The following table shows the configurable choices for the Cortex-M23 processor and includes the options that are constrained for the SSE-123 Example Subsystem.

Table 1-2 Integrated IP configuration options

Feature	Configurable options
Non-secure <i>Memory Protection Unit</i> (MPU)	8, 12, 16 regions.
Secure MPU	8, 12, 16 regions.
<i>Security Attribution Unit</i> (SAU)	Fixed 8 regions.
SysTick timers	0, 1, or 2 timers can be present. If only one timer is present, it is configurable by software whether it is Secure or Non-secure.
<i>Vector Table Offset Register</i> (VTOR)	Fixed present.
Reset all registers	Present or absent.
Multiplier	Fast, one cycle, or slow, 32 cycles.
Divider	Fast, 17 cycles, or slow, 34 cycles.
Interrupts	Fixed to 16 + subsystem expansion interrupts.
Instruction fetch width	16-bit only or 32-bit.
Single-Cycle I/O port	Present or absent. Must be present for subsystem Single-Cycle I/O port.
Architectural clock gating	Present or absent.
Data endianness	Fixed little-endian.
Halting debug support	Present or absent. Must be present for subsystem debug support.
Wake-up interrupt controller	Fixed present.
Number of breakpoint comparators	0, 1, 2, 3, 4.
Number of watchpoint comparators	0, 1, 2, 3, 4.
<i>Cross Trigger Interface</i> (CTI)	Present or absent. Must be present for subsystem debug support.
<i>Micro Trace Buffer</i> (MTB)	Fixed absent.
<i>Embedded Trace Macrocell</i> (ETM)	Present or absent. Must be present for subsystem debug trace.
JTAGnSW debug protocol	Selects between JTAG or Serial-Wire interfaces for the DAP.
Multi-drop support for serial wire	Present or absent.
Slave port support for AHB DAP	When set, include slave port support for any AHB DAP implementation. Otherwise, support only the low area DAP.

1.6 Product documentation

This section describes the SSE-123 product documentation in relation to the design flow.

This section contains the following subsection:

- [1.6.1 Documentation on page 1-18.](#)

1.6.1 Documentation

The SSE-123 Example Subsystem documentation is as follows:

Technical Overview

The *Technical Overview* (TO) provides a high-level overview of the SSE-123 Example Subsystem:

- Hardware.
- Software.

Technical Reference Manual

The *Technical Reference Manual* (TRM) describes the functionality and the effects of functional options on the behavior of the SSE-123 Example Subsystem. It is required at all stages of the design flow. The choices that are made in the design flow can mean that some behaviors that are described in the TRM are not relevant. If you are programming the SSE-123, then contact:

- The implementer to determine:
 - The build configuration of the implementation.
 - The integration, if any, that was performed before implementing the SSE-123.
- The integrator to determine the pin configuration of the device that you are using.

Configuration and Integration Manual

The *Configuration and Integration Manual* (CIM) describes:

- The available build configuration options and related issues in selecting them.
- Guidelines on how to integrate the SSE-123 Example Subsystem into an SoC.
- The SSE-123 Integration component, providing examples of integration with Arm eFlash and debug products.
- The processes to sign off the configuration, integration, and physical implementation of the design.

The CIM is a confidential book that is only available to licensees.

Verification Summary Report

The *Verification Summary Report* (VSR) describes:

- An overview of verification performed on the SSE-123 Example Subsystem.
- The verification quality definition for the subsystem.
- Configurations of the subsystem verified.
- A summary of verification results.

The VSR is a confidential book that is only available to licensees.

Subsystem Analysis Report

The *Subsystem Analysis Report* (SAR) describes:

- Performance characteristics of the SSE-123 Example Subsystem.
- Processor performance analysis and benchmark results.
- Performance analysis of memory system bandwidth and latency.

The SAR is a confidential book that is only available to licensees.

1.7 Product revisions

This section describes the differences in functionality between product revisions:

r0p0 First release.

Chapter 2

Functional description

This chapter describes the functionality of the SSE-123 Example Subsystem.

It contains the following sections:

- [2.1 Clocks on page 2-21.](#)
- [2.2 Resets on page 2-24.](#)
- [2.3 Power management on page 2-28.](#)
- [2.4 Central processor on page 2-31.](#)
- [2.5 Interconnect on page 2-33.](#)
- [2.6 Debug on page 2-34.](#)
- [2.7 Security control on page 2-36.](#)
- [2.8 Peripherals on page 2-38.](#)
- [2.9 Subsystem SRAM on page 2-39.](#)

Clocks

This section describes the clocks in the SSE-123 Example Subsystem.

Top-level overview

The following figure shows the SSE-123 Example Subsystem clock structure, including *Clock Controllers* (CCs) and *Power Policy Units* (PPUs) that control the *Clock Gates* (CGs) in the subsystem.

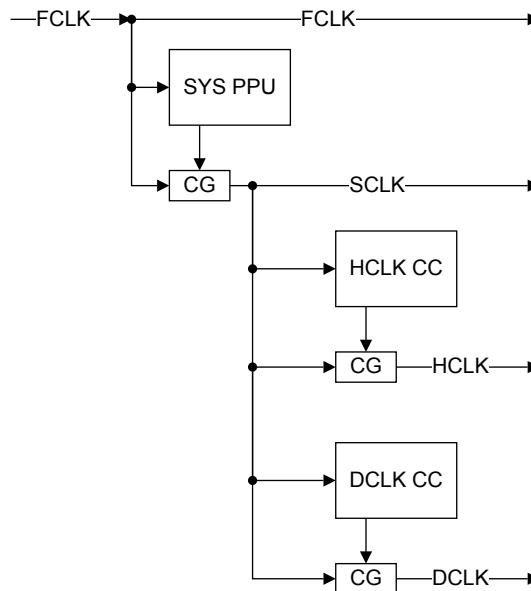

Figure 2-1 Top-level overview of SSE-123 Example Subsystem clocks

All clocks in the subsystem are synchronous to a single input clock, **FCLK**.

The **FCLK** signal clocks the following:

- Subsystem control logic.
- Cortex-M23 *Wakeup Interrupt Controller* (WIC).
- Subsystem timers.
- Subsystem watchdogs.

The subsystem considers **FCLK** to be free running, but can be gated outside the subsystem if it is in the CSS.OFF power state. See [2.3.3 Subsystem power states on page 2-28](#).

The following clock is derived from **FCLK**:

SCLK Clocks the Cortex-M23 *Nested Vector Interrupt Controller* (NVIC) and system control logic in PD_SYS. **SCLK** is gated when the subsystem is in CSS.SLEEP power state. See [2.3.3 Subsystem power states on page 2-28](#).

The following clocks are derived from **SCLK** and support dynamic clock gating:

HCLK	Clocks the Cortex-M23 and subsystem interconnect.
-------------	---

DCLK Closes the subsystem debug components.

This section contains the following subsections:

- *2.1.1 Clock control on page 2-22.*
- *2.1.2 External wakeup on page 2-22.*
- *2.1.3 Clock domain expansion on page 2-22.*
- *2.1.4 FCLK dynamic clock switching on page 2-23.*

2.1.1 Clock control

This section describes how clocks are controlled in the SSE-123 Example Subsystem.

FCLK

Control of **FCLK** is expected to be integrated outside the subsystem. When the system is in operation, it is expected that **FCLK** is free-running. The frequency of **FCLK** can be switched during operation. See [2.1.4 FCLK dynamic clock switching on page 2-23](#).

SCLK

The power state determines the clock gating of **SCLK**. The **SCLK** clock is enabled during the ON power mode. Otherwise, the **SCLK** clock is gated. **SCLK** is provided as an output from the subsystem to enable customers to include devices in the clock domain.

HCLK

A Q-Channel clock controller controls the dynamic clock gating of **HCLK**. The **HCLK** clock is gated only when all devices within the clock domain indicate no activity and accept a request for quiescence. **HCLK** is provided as an output from the subsystem to enable customers to include devices in the clock domain. To enable safe dynamic gating of **HCLK**, connect the **HCLK** Q-Channel interface to all devices outside the subsystem that use **HCLK**.

DCLK

A Q-Channel clock controller controls the dynamic clock gating of **DCLK**. The **DCLK** clock is gated only when all devices within the clock domain indicate no activity and accept a request for quiescence. **DCLK** is provided as an output from the subsystem to enable customers to include devices in the clock domain. To enable safe dynamic gating of **DCLK**, connect the **DCLK** Q-Channel interface to all devices outside the subsystem that use **DCLK**.

2.1.2 External wakeup

This section describes the methods that you can use to wake gated clocks.

You can wake gated clocks in the SSE-123 Example Subsystem using the following mechanisms:

Clock QACTIVE

Raising a clock **QACTIVE** signal on the relevant clock domain expansion Q-Channel interface causes the clock controller to ungate the respective clock.

Power QACTIVE

Raising a power **QACTIVE** signal on the relevant power domain expansion Q-Channel interface causes the *Power Policy Unit* (PPU) to transition to an ON state. This transition ungates the required clocks.

Wakeup Interrupt Controller

The *Wakeup Interrupt Controller* (WIC) operates on **FCLK** to enable it to detect an interrupt and wake the processor from deep sleep. This operation ungates the **SCLK** and **HCLK** domains.

2.1.3 Clock domain expansion

All generated clocks are exported from the subsystem to enable you to add logic in any clock domain.

See [Appendix A Signal descriptions on page Appx-A-84](#) for information about the clock that is associated with each external interface.

Expansion Q-Channel interfaces are provided for each of the following dynamic clock gated domains:

- **HCLK**.
- **DCLK**.

You must integrate these interfaces with components that are external to the subsystem to ensure that the devices are idle before the clocks are gated. See [A.3 Clock control interface signals](#) on page Appx-A-87.

2.1.4 FCLK dynamic clock switching

The SSE-123 Example Subsystem supports dynamic switching of the frequency of the **FCLK** signal.

Dynamic frequency switching enables the **FCLK** that is supplied to the subsystem to be switched from a high frequency clock to a low frequency clock. This can enable dynamic power saving by switching off high frequency clock generation logic, such as a *Phase Locked Loop* (PLL). The **FCLKSTATEREQn** interface indicates when the system is requesting a high frequency clock.

The FCLK_DCS_ENABLE bits in the *CLOCK_CTRL*, *Clock Control register* on page 3-53 control dynamic clock switching.

The following table shows the **FCLKSTATEREQn** signal in various system power states. See [2.3.3 Subsystem power states](#) on page 2-28.

Table 2-1 FCLK dynamic clock switching states

Subsystem power state	Cortex-M23 processor core sleep state	FCLK_DCS_ENABLE	FCLKSTATEREQn
CSS.ON	M23.RUNNING	2'b00	LOW
CSS.ON	M23.SLEEPING	2'b00	LOW
CSS.ON	M23.DEEPSLEEP	2'b00	LOW
CSS.SLEEP	M23.DEEPSLEEP	2'b00	LOW
CSS.ON	M23.RUNNING	2'b01	LOW
CSS.ON	M23.SLEEPING	2'b01	LOW
CSS.ON	M23.DEEPSLEEP	2'b01	HIGH
CSS.SLEEP	M23.DEEPSLEEP	2'b01	HIGH
CSS.ON	M23.RUNNING	2'b10	LOW
CSS.ON	M23.SLEEPING	2'b10	LOW
CSS.ON	M23.DEEPSLEEP	2'b10	LOW
CSS.SLEEP	M23.DEEPSLEEP	2'b10	HIGH

2.2 Resets

This section describes the reset signals in the SSE-123 Example Subsystem.

Top-level overview

The following figure shows the SSE-123 Example Subsystem generated resets, and associated reset control and request signals.

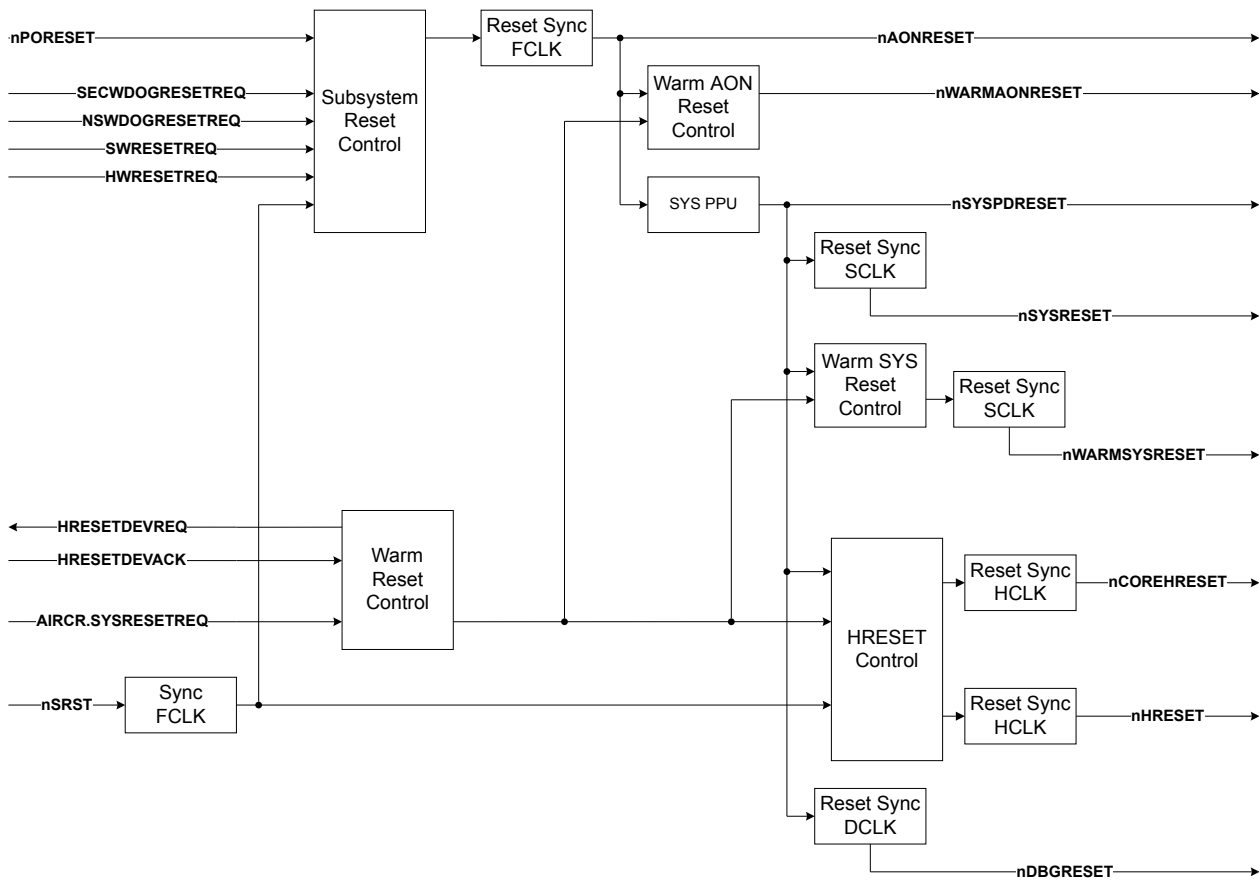

Figure 2-2 SSE-123 Example Subsystem reset structure

The SSE-123 Example Subsystem contains a single reset input, **nPORESET**, that generates all internal resets.

The **nPORESET** reset signal is used for logic in the **PD_AON** power domain of the subsystem. The **nPORESET** reset signal causes all devices in the subsystem to be reset. The SSE-123 Example Subsystem expects that **nPORESET** release is synchronous to **FCLK**.

This section contains the following subsections:

- [2.2.1 Internally generated resets on page 2-24.](#)
- [2.2.2 Reset requests on page 2-25.](#)
- [2.2.3 Reset control on page 2-26.](#)

2.2.1 Internally generated resets

This section describes the internally generated resets in the SSE-123 Example Subsystem.

The SSE-123 Example Subsystem contains the following internally generated resets:

nAONRESET

The **nAONRESET** reset signal is a reset that the SYS reset control generates for all logic in the **PD_AON** power domain, except for the *RESET_SYNDROME, Reset Syndrome register* on page 3-54 and *RESET_MASK, Reset Mask register* on page 3-55.

This domain resets the following:

- *Power Policy Unit (PPU).*
- System timers.
- System watchdogs.

nWARMAONRESET

The **nWARMAONRESET** reset signal is the reset for subsystem control registers in the **PD_AON** that must be reset when an AIRCR.SYSRESETREQ request is raised. See *3.3.1 Subsystem information registers block* on page 3-46 for information about the registers that this reset affects.

nSYSPDRESET

The **nSYSPDRESET** reset signal is a reset that SYS PPU generates for all logic in **PD_SYS** power domain.

nSYSRESET

The **nSYSRESET** reset signal is a system domain reset for all non-debug logic in the **PD_SYS** power domain. **nSYSRESET** is a reset for the Cortex-M23 processor system domain, including Cortex-M23 processor *Nested Vector Interrupt Controller (NVIC)*.

nWARMSYSRESET

Reset for subsystem clock control logic in **PD_SYS** that requires reset when a AIRCR.SYSRESETREQ is raised.

nHRESET

The **nHRESET** reset signal is a reset for the following:

- Interconnect.
- *Peripheral Protection Controller (PPC).*
- *Memory Protection Controller (MPC).*
- *Static Random Access Memory (SRAM).*

nCOREHRESET

The **nCOREHRESET** reset signal is a reset for the Cortex-M23 core.

nDBGRESET

The **nDBGRESET** reset signal is a reset for the Cortex-M23 debug domain.

2.2.2 Reset requests

The SSE-123 Example Subsystem responds to a range of reset requests that this section describes.

The following table shows the reset request sources for the SSE-123 Example Subsystem.

Table 2-2 SSE-123 Example Subsystem subsystem requests

Name	Source	Description
nSRST	Input signal	<p>You can connect this reset request to the debugger physical interface. It causes the logic in the subsystem to be reset and holds the processor core in reset while nSRST is LOW.</p> <p>————— Note —————</p> <p>nSRST causes reset of the debug logic within the subsystem.</p> <p>—————</p> <p>For more information about nSRST, see the <i>Arm® Debug Interface Architecture Specification, ADIV5.0 to ADIV5.2</i>.</p>
SWRESETREQ	Register	Software reset request from the subsystem control registers block. See SWRESET, Software Reset register on page 3-55 .
HWRESETREQ	Input signal	Hardware reset request enables components that are external to the subsystem to request reset.
SECWDGRESETREQ	Secure watchdog	The Secure watchdog can request a reset, after a pre-programmed period has elapsed. See 2.8.2 Subsystem watchdogs on page 2-38 .
NSWDGRESETREQ	Non-secure watchdog	<p>The Non-secure watchdog can request a reset, after a pre-programmed period has elapsed. See 2.8.2 Subsystem watchdogs on page 2-38.</p> <p>Software can choose to unmask this reset request by writing to RESET_MASK.NSWD_EN. By default, this reset request is masked. See RESET_MASK, Reset Mask register on page 3-55.</p>
AIRCR.SYSRESETREQ	Cortex-M23	<p>Cortex-M23 processor system reset request. When HIGH, indicates that program code or a debugger writing to the AIRCR.SYSRESETREQ bit has requested a reset.</p> <p>This bit enables software or a debugger to request reset of the core.</p> <p>Software can choose to unmask this reset request by writing to the RESET_MASK.SYSRESETREQ_EN bit. By default, this reset request is masked.</p> <p>See RESET_MASK, Reset Mask register on page 3-55.</p>

You can mask some of the requests by programming software registers. See [RESET_MASK, Reset Mask register on page 3-55](#) for more information.

2.2.3 Reset control

This section describes how to control resets in the SSE-123 Example Subsystem.

The figure in [2.2 Resets on page 2-24](#) shows the following reset control blocks that control the resets resulting from the requests that [2.2.2 Reset requests on page 2-25](#) describes.

- Subsystem reset control:
 - Controls the reset of **nAONRESET**.
 - Any of the following reset requests causes the resets to be asserted until the request is cleared:
 - nSRST** falling edge.
 - SWRESETREQ**.
 - HWRESETREQ**.
 - SECWDGRESETREQ**.
 - NSWDGRESETREQ**.
- Warm reset control:
 - Manages generation of reset requests for:

- Warm AON reset control.
- Warm SYS reset control.
- **HRESET** control.
- A reset request from AIRCR.SYSRESETREQ does not cause immediate reset of **nWARMAONRESET**, **nWARMSYSRESET**, **nHRESET**, and **nCOREHRESET**. Instead, a request is raised to an external interface of the subsystem.
 - **HRESETDEVREQ** is raised to indicate that a reset is to occur for components that are integrated in the **nHRESET** domain.
 - The external system drives **HRESETDEVACK** to indicate that all expansion devices in the **nHRESET** domain can be safely reset.
 - **HRESETDEVREQ** deasserts only after the **nHRESET** domain goes through a reset sequence and then the domain is released from reset.
 - The **HRESETDEVREQ/HRESETDEVACK** interface uses a four-phase handshake protocol to enable connection asynchronously to an external reset controller.
- Warm AON reset control:
 - Controls the reset of **nWARMAONRESET**.
 - Any of the following reset requests causes the reset to be asserted until the request is cleared:
 - All system reset control reset requests.
 - All AON reset control reset requests.
 - AIRCR.SYSRESETREQ.
- Warm SYS reset control:
 - Controls the reset of **nWARMSYSRESET**.
 - Any of the following reset requests causes the reset to be asserted until the request is cleared:
 - All system reset control reset requests.
 - All AON reset control reset requests.
 - AIRCR.SYSRESETREQ.
- **HRESET** control:
 - Controls the reset of **nHRESET** and **nCOREHRESET**.
 - Any of the following reset requests causes the resets to be asserted until the request is cleared:
 - All system reset control reset requests.
 - All AON reset control reset requests.
 - AIRCR.SYSRESETREQ.
 - The state of **nSRST** also controls **nHRESET** and **nCOREHRESET**:
 - The falling edge of **nSRST** causes reset of **nHRESET** and **nCOREHRESET**.
 - **nCOREHRESET** is held in reset while **nSRST** is LOW.

2.3 Power management

This section describes the power management in the SSE-123 Example Subsystem.

This section contains the following subsections:

- [2.3.1 Voltage domain on page 2-28.](#)
- [2.3.2 Power domains on page 2-28.](#)
- [2.3.3 Subsystem power states on page 2-28.](#)
- [2.3.4 Entering low-power states on page 2-29.](#)
- [2.3.5 Wakeup from low-power states on page 2-29.](#)
- [2.3.6 Power domain expansion on page 2-29.](#)
- [2.3.7 Wakeup Interrupt Controller \(WIC\) and WIC-bridge on page 2-30.](#)

2.3.1 Voltage domain

The SSE-123 Example Subsystem operates on a single voltage domain, **VSYS**.

2.3.2 Power domains

The SSE-123 Example Subsystem supports power domains to enable subsystem power-saving states.

The SSE-123 Example Subsystem supports the following power domains:

- An always on power domain, **PD_AON**.
- A switchable power domain, **PD_SYS**.

The hierarchy of the power domains is as follows:

PD_AON Contains the following:

- WIC.
- Timers.
- Watchdogs.

PD_AON must be implemented as an always-on power domain.

PD_SYS Contains the SRAM and most subsystem components, including the following:

- Cortex-M23 processor.
- Subsystem interconnect.

Controlled by the PCK-600 PPU integrated into the subsystem:

- Supports the following power states:
 - ON.
 - MEM_RET.
 - OFF.
- Supports dynamic power state transitions.

2.3.3 Subsystem power states

This section describes the subsystem power states in the SSE-123 Example Subsystem.

The following table shows the supported power states of the subsystem. The *Power Policy Unit* (PPU) configuration implements the valid power states for the switchable **PD_SYS** domain.

See the *Arm® SSE-123 Example Subsystem Configuration and Integration Manual* for information about configuration of the SYS PPU.

Table 2-3 Subsystem power states

Subsystem power state	PD_AON power state	PD_SYS power state
CSS.RUN	ON	ON
CSS.SLEEP	ON	MEM_RET/OFF
CSS.OFF	OFF	OFF

2.3.4 Entering low-power states

This section describes the subsystem power states in the SSE-123 Example Subsystem.

The *Power Policy Unit* (PPU) controls entering low-power states under the following conditions:

Entering CSS.SLEEP

- The processor must be in *deep sleep* to enter low-power mode.
- The WIC bridge must be enabled by setting **WICBRGEN**.
- The system PPU must be programmed to dynamically transition to a low-power state, MEM_RET/OFF.
- Transition only completes if the PPU completes requests to the following devices:
 - WIC bridge is enabled successfully.
 - Processor power down request is accepted.
 - Expansion **PD_SYS** power Q-Channel power down request is accepted.

2.3.5 Wakeup from low-power states

This section describes wakeup from low-power states in the SSE-123 Example Subsystem. The subsystem enters the CSS.OFF state only when **VSYS** is switched OFF. To wake up from the CSS.OFF state, the system must have power that is applied to **PD_AON**, and have **nPORESET** asserted.

Wakeup from the CSS.SLEEP state to the CSS.RUN state can occur from the following reasons:

- The *Wakeup Interrupt Controller* (WIC) detects an interrupt. See [2.3.7 Wakeup Interrupt Controller \(WIC\) and WIC-bridge on page 2-30](#). The following conditions enable an interrupt as a wakeup source:
 - The interrupt must be included as a wakeup source during the configuration of the subsystem.
 - The *Nested Vector Interrupt Controller* (NVIC) must enable the interrupt, and this in turn enables the interrupt in the WIC.

The **WICSENSE** output shows the interrupt lines enabled as wakeup sources.

- The WIC detects an event. See [2.3.7 Wakeup Interrupt Controller \(WIC\) and WIC-bridge on page 2-30](#).
- Activity that the **PD_SYS** Power Q-Channel interface indicates. See [A.9.1 PD_SYS power Q-Channel signals on page Appx-A-93](#).
- Debug powerup request by the debug power interface. See [A.9.2 Debug power interface signals on page Appx-A-93](#).

2.3.6 Power domain expansion

This section describes the power domain expansion in the SSE-123 Example Subsystem. Power control Q-Channel interfaces are provided to enable the integration of devices within the subsystem power domains.

These interfaces must be integrated with expansion devices that are included in the associated power domains to enable safe power state transitions.

The debug power interface enables an external debugger to power up the system when required.

A power status output, **SYSPPUHWSTAT**, is provided from the *Power Policy Unit* (PPU) to indicate the current power state.

2.3.7 Wakeup Interrupt Controller (WIC) and WIC-bridge

This section describes the *Wakeup Interrupt Controller* (WIC) and WIC-bridge in the SSE-123 Example Subsystem.

The Cortex-M23 processor WIC is integrated in the subsystem to handle interrupts when the processor *Nested Vector Interrupt Controller* (NVIC) is in a low-power sleep mode.

The Cortex-M23 processor does not natively support a power domain boundary between the WIC and the NVIC. A WIC-bridge is implemented in the subsystem to enable the **PD_SYS** domain to be powered off, and then be woken up by the WIC.

The WIC is enabled when transitioning to the CSS.SLEEP power state. Software controls the WIC-bridge using the following procedures:

Powering down

1. Enable the WIC-bridge using the [WICBRGCTRL, WIC Bridge Control register on page 3-58](#) to isolate communication between the WIC and the NVIC.
2. Set SCR.SLEEPDEEP to enable the processor to enter the deep sleep state.
3. Configure the SYS PPU to dynamically request the power OFF state when there is no device activity, and then send the processor into the deep sleep mode using one of the following:
 - A WFI instruction.
 - A WFE instruction.
 - A sleep-on-exit function.

Waking up

1. The WIC observes an unmasked interrupt and causes the PD_SYS power domain to wakeup.
2. Disable the WIC-bridge using the [WICBRGCTRL, WIC Bridge Control register on page 3-58](#) to re-enable the communication between the WIC and the NVIC.
3. Service the interrupt.
4. The pending interrupt is cleared from the WIC.

2.4 Central processor

This section describes the central processor in the SSE-123 Example Subsystem.

The central processor is located in the following domains:

Power domain PD_SYS

Reset domains nSYSRESET, nCOREHRESET, and nDBGRESET.

The central processor in the subsystem is a single Cortex-M23 processor. The processor always includes Armv8-M Security Extension to support Arm TrustZone® for asset protection.

[1.5.2 Processor configuration options on page 1-16](#) describes the rendering and parameter configuration of the processor.

The following table shows the static configuration signals for the processor.

Table 2-4 Cortex-M23 processor static configuration signals

Signal name	Tie value	Description
CFGSTCALIB[25:0]	0x200_0000	Secure SysTick calibration configuration. No alternative reference clock is provided, and the frequency of the clock arriving at the processor is not computable in hardware: CFGSTCALIB[25] NOREF = HIGH. CFGSTCALIB[24] SKEW = LOW. CFGSTCALIB[23:0] TENMS = 0x00_0000.
CFGSTCALIBNS[25:0]	0x200_0000	Secure SysTick calibration configuration. No alternative reference clock is provided, and the frequency of the clock arriving at the processor is not computable in hardware: CFGSTCALIBNS[25] NOREF = HIGH. CFGSTCALIBNS[24] SKEW = LOW. CFGSTCALIBNS[23:0] TENMS = 0x00_0000.
CFGSECEXT	1	Armv8-M security support enabled.
INITVTOR[23:0]	Driven by the INITVTOR, Initial Secure Vector Table Offset register on page 3-56 .	Default Secure vector table offset at reset.
INITVTORNS[23:0]	Set by a configuration parameter during integration of the subsystem.	Default Non-secure vector table offset at reset.
IRQLATENCY[7:0]		The Cortex-M23 processor supports zero jitter interrupt latency for zero wait-state memory. IRQLATENCY specifies the minimum number of cycles between an interrupt that becomes pending in the <i>Nested Vector Interrupt Controller</i> (NVIC), and the vector fetch for that interrupt being issued on the AHB-Lite interface. For more information, see the <i>Arm® Cortex®-M23 Processor Technical Reference Manual</i> .

This section contains the following subsections:

- [2.4.1 Implementation Defined Attribution Unit \(IDAU\) on page 2-32.](#)
- [2.4.2 Processor interface expansion on page 2-32.](#)

2.4.1 Implementation Defined Attribution Unit (IDAU)

This section describes the *Implementation Defined Attribution Unit* (IDAU) in the central processor of the SSE-123 Example Subsystem.

The subsystem integrates an IDAU that defines the security attributes of the memory map along with the software-programmable *Security Attribution Unit* (SAU).

16 regions are defined from 0x0-0xF with fixed security level as the table in [3.2 Subsystem memory map on page 3-42](#) defines. The final security level of a region is the highest security level of both SAU and IDAU region definitions.

For more information, see the *Arm® Cortex®-M23 Processor Technical Reference Manual*.

2.4.2 Processor interface expansion

This section describes how to expand processor interfaces in the SSE-123 Example Subsystem.

Single cycle I/O interface

The Cortex-M23 processor implements an optional single-cycle *I/O Port* (IOP). The subsystem can expose this interface to enable the connection of peripherals outside the subsystem.

The IOP has the following features and limitations:

- Low latency access between the processor and tightly coupled peripherals, such as the *General-Purpose I/O* (GPIO).
- Code cannot be executed from the IOP.
- Peripherals that are integrated on the IOP are only accessible from the processor and the debugger.

For more information, see the *Arm® Cortex®-M23 Processor Technical Reference Manual*.

Interrupt expansion interface

The interrupt expansion interface enables external devices to connect interrupts to the subsystem. Expansion interrupts can be configured to wake up the subsystem from low-power states using the *Wakeup Interrupt Controller* (WIC).

2.5 Interconnect

This section describes the interconnect in the SSE-123 Example Subsystem.

The subsystem integrates a single SIE-200 multi-layer AHB5 bus matrix to connect the subsystem components and expansion interfaces. SIE-200 AHB to APB bridges are integrated to cross power and clock domain boundaries.

For more information, see the *Arm® CoreLink™ SIE-200 System IP for Embedded Technical Reference Manual*.

This section contains the following subsections:

- [2.5.1 Interconnect expansion interfaces on page 2-33](#).
- [2.5.2 Exclusive access support on page 2-33](#).

2.5.1 Interconnect expansion interfaces

This section describes the expansion interfaces in the SSE-123 Example Subsystem that enable you to integrate extra devices.

See [3.2 Subsystem memory map on page 3-42](#) for information about the memory regions that these interfaces access.

The subsystem provides the following interfaces:

AHB5 slave expansion interface

Enables extra masters to access the subsystem using the AHB5 interconnect. To ensure the TBSA-M compatibility of extra masters, it might be necessary to add a security wrapper such as the SIE-200 *Master Security Controller* (MSC) to this interface.

See the *ARM® CoreLink™ SIE-200 System IP for Embedded Technical Reference Manual*.

AHB5 master expansion interface 0

Enables extra slave devices to be added in the code and SRAM memory regions of the address map. To ensure TBSA-M compatibility of extra devices, it might be necessary to add a gating device such as the SIE-200 *Memory Protection Controller* (MPC) to this interface.

See the *ARM® CoreLink™ SIE-200 System IP for Embedded Technical Reference Manual*.

AHB master expansion interface 1

Enables extra slave devices to be added to the subsystem. To ensure TBSA-M compatibility of extra devices, it might be necessary to add a gating device such as SIE-200 *Peripheral Protection Controller* (PPC) or MPC.

See the *ARM® CoreLink™ SIE-200 System IP for Embedded Technical Reference Manual*.

2.5.2 Exclusive access support

The SSE-123 Example Subsystem supports the propagation of exclusive access signaling.

There are no slaves within the subsystem that support exclusive access. However, you can add a slave that supports exclusive access outside the subsystem using the AHB expansion interfaces. The processor can make exclusive accesses to the slave that is connected on the master expansion interface.

2.6 Debug

This section describes the debug in the SSE-123 Example Subsystem. The subsystem optionally integrates debug components within the subsystem to provide standard debug interfaces for integration with expansion logic.

There are three levels of debug features that you can select when you configure the subsystem:

Level 0 No debug components, features, or interfaces are available.

Level 1 The Cortex-M23 processor is configured with a *Debug Access Port* (DAP) that provides access to the core debug system.

The Cortex-M23 processor *Cross Trigger Interface* (CTI) is included in the subsystem to enable the integration of processor triggers using a CTI.

The debug APB interconnect is included in the subsystem to provide bus access to debug components.

You can extend the debug subsystem by using the top-level debug APB interface.

Level 2 All components, features, and interfaces of level 1 are included.

Also, the Cortex-M23 processor *Embedded Trace Macrocell* (ETM) is included in the subsystem to enable integration of the processor instruction trace through the ATB Interface.

This section contains the following subsections:

- [2.6.1 Debug authentication on page 2-34.](#)
- [2.6.2 Debug Access Port \(DAP\) on page 2-34.](#)
- [2.6.3 Cross triggers on page 2-35.](#)
- [2.6.4 Trace on page 2-35.](#)
- [2.6.5 Debug expansion on page 2-35.](#)

2.6.1 Debug authentication

This section describes the debug authentication in the SSE-123 Example Subsystem. The subsystem implements the CoreSight authentication interface signals.

You can control these CoreSight authentication interface signals by using:

- An external interface.
- The following subsystem control registers:
 - [SECDBGSTAT, Secure Debug Status register on page 3-49.](#)
 - [SECDBGSET, Secure Debug Set register on page 3-51.](#)
 - [SECDBGCLR, Secure Debug Clear register on page 3-51.](#)

For definitions of the authentication interface signals, see the *Arm® CoreSight™ Architecture Specification v3.0*.

2.6.2 Debug Access Port (DAP)

This section describes the *Debug Access Port* (DAP) in the SSE-123 Example Subsystem. You can configure the subsystem to export the Cortex-M23 processor debug slave interface to enable the connection of M23-DAP or CoreSight DAP.

For more information, see the *Arm® Cortex®-M23 Processor Technical Reference Manual*.

The Cortex-M23 processor debug ROM at 0xE00FF000 defines the debug components within the subsystem. For information about the Cortex-M23 processor ROM table entries, see *Table 7-1* in the *Arm® Cortex®-M23 Processor Technical Reference Manual*.

All the debug components are available in the memory region 0xE000E000-0xE00FFFFF. For the full debug memory map descriptions, see the table in [3.2 Subsystem memory map on page 3-42.](#)

2.6.3 Cross triggers

This section describes the cross triggers in the SSE-123 Example Subsystem. You can configure the subsystem to include a Cortex-M23 processor *Cross Trigger Interface* (CTI). A cross trigger channel interface is provided to enable the integration to a trigger network outside the subsystem. Examples of integrating trigger networks outside the subsystem include the addition of a CTI or *Cross Trigger Matrix* (CTM).

For more information about the Cortex-M23 processor CTI, and the mapping of triggers, see *Appendix G* in the *Arm® Cortex®-M23 Processor Integration and Implementation Manual*.

2.6.4 Trace

This section describes the trace in the SSE-123 Example Subsystem. You can configure the subsystem to include the Arm CoreSight ETM-M23. The CoreSight ETM-M23 supports instruction trace only. An ATB interface to the *Embedded Trace Macrocell* (ETM) is provided to connect to an external debug system. You can also connect directly to a *Trace Port Interface Unit* (TPIU).

For more information, see the *Arm® CoreSight™ ETM-M23 Technical Reference Manual*.

2.6.5 Debug expansion

This section describes the debug expansion in the SSE-123 Example Subsystem. You can add extra debug components outside the subsystem using the APB *debug expansion interface*.

A debug ROM might be required to discover components that are added in the expansion region, outside the subsystem. Any debug ROM that is added outside the subsystem must direct the debugger to the Cortex-M23 processor debug ROM within the subsystem.

If no debug components are required outside the subsystem, the debugger can discover the debug components starting at the Cortex-M23 processor debug ROM.

2.7 Security control

This section describes security control in the SSE-123 Example Subsystem.

The following register blocks manage security control in the subsystem:

- [3.3.3 Secure privilege control registers block on page 3-59](#).
- [3.3.4 Non-secure privilege control registers block on page 3-77](#).

The subsystem implements the following protection controllers that the Secure and Non-secure privilege control register blocks control:

- *Memory Protection Controller* (MPC) for the subsystem SRAM.
- *Peripheral Protection Controller* (PPC) for the subsystem peripherals.

This section contains the following subsections:

- [2.7.1 Peripheral protection controller on page 2-36](#).
- [2.7.2 Memory protection controller on page 2-36](#).
- [2.7.3 Security expansion on page 2-36](#).

2.7.1 Peripheral protection controller

This section describes the *Peripheral Protection Controller* (PPC) in the SSE-123 Example Subsystem.

The PPC is located in the following domains:

Power domain	PD_SYS
Reset domain	nHRESET.

The SIE-200 APB4 PPC component is integrated to gate access to subsystem APB peripherals. If an access violation occurs when accessing a protected peripheral, an interrupt is raised.

The [3.3.3 Secure privilege control registers block on page 3-59](#) and [3.3.4 Non-secure privilege control registers block on page 3-77](#) control the settings of the PPC.

2.7.2 Memory protection controller

This section describes the *Memory Protection Controller* (MPC) in the SSE-123 Example Subsystem.

The MPC is located in the following domains:

Power domain	PD_SYS
Reset domain	nHRESET.

The SIE-200 AHB5 MPC component is integrated to gate transactions to the SRAM. If the address is protected, a security violation occurs.

The **cfg_init_value** MPC input is tied LOW so that at boot, the SRAM is Secure only access. During operation, software can program the settings of the MPC to enable Non-secure access.

See [3.3.8 SRAM memory protection control on page 3-82](#).

The SRAM MPC parameters are set by options that you select during the configuration of the subsystem.

The *Arm® SSE-123 Example Subsystem Configuration and Integration Manual* defines the SRAM MPC parameters.

2.7.3 Security expansion

This section describes the security expansion in the SSE-123 Example Subsystem. The SSE-123 Example Subsystem provides interfaces for the security control of components outside the subsystem.

See [A.15 Security control expansion signals on page Appx-A-107](#).

These interfaces enable software to manage the security of devices that are added in the expansion region using the [3.3.3 Secure privilege control registers block on page 3-59](#) and [3.3.4 Non-secure privilege control registers block on page 3-77](#).

The subsystem supports expansion for:

- Interrupt signaling for:
 - 16 *Memory Protection Controller* (MPC) security violation interrupts.
 - Four *AHB Peripheral Protection Controller* (PPC) security violation interrupts.
 - Four APB PPC security violation interrupts.
 - 16 *Master Security Controller* (MSC) security violation interrupts.
 - 16 bridge error interrupts.
- Security gating control for:
 - 64 APB peripheral devices.
 - 16 AHB peripheral devices.
- Privilege gating control for:
 - 64 APB peripheral devices.
 - 16 AHB peripheral devices.

2.8 Peripherals

This section describes the peripherals in the SSE-123 Example Subsystem.

This section contains the following subsections:

- [2.8.1 Subsystem Timers on page 2-38.](#)
- [2.8.2 Subsystem watchdogs on page 2-38.](#)

2.8.1 Subsystem Timers

This section describes the System Timers in the SSE-123 Example Subsystem.

The subsystem integrates two System Timers. See [Appendix B System time components on page Appx-B-114.](#)

The timers operate on the **TSVALUEB_SYS** timestamp input. This enables the subsystem to be included in a shared view of time when integrated into a larger system.

Software can configure each timer condition. When a timer condition is met, an interrupt is raised.

The timer interrupts can be used to wake the **PD_SYS** domain but must be configured to do so before powering down **PD_SYS**. Configuration of the timer is only available when the system is in the **CSS.RUN** state.

2.8.2 Subsystem watchdogs

This section describes the watchdogs in the SSE-123 Example Subsystem.

The subsystem implements a Secure and Non-secure Subsystem Watchdog. See [Appendix B System time components on page Appx-B-114.](#)

The subsystem watchdogs operate on the **TSVALUEB_SYS** timestamp input. This enables the subsystem to be included in a shared view of time when integrated into a larger system.

Each system watchdog has two interrupt levels that are raised when timeout occurs.

The Non-secure system watchdog can raise an initial timeout interrupt to the processor core. A second timeout raises a second, separate interrupt to the processor core. Software can also choose to raise a reset request on the second watchdog timeout that directly resets the system.

The Secure system watchdog can raise an initial timeout *Non-Maskable Interrupt* (NMI) to the processor core. A second timeout raises a reset request that directly resets the system.

2.9 Subsystem SRAM

This section describes the subsystem SRAM in the SSE-123 Example Subsystem.

The subsystem integrates one bank of single port SRAM that supports zero clock cycle latency. An SIE-200 AHB to SRAM component is integrated to connect the SRAM bank in the subsystem.

All accesses to the SRAM are through a SIE-200 AHB5 MPC. The MPC manages security for the SRAM. See [2.7.2 Memory protection controller on page 2-36](#).

Chapter 3

Programmers model

This chapter describes the programmers model for the SSE-123 Example Subsystem.

It contains the following sections:

- [3.1 About the programmers model](#) on page 3-41.
- [3.2 Subsystem memory map](#) on page 3-42.
- [3.3 Subsystem register descriptions](#) on page 3-46.
- [3.4 Subsystem interrupt map](#) on page 3-83.

3.1 About the programmers model

This section describes the programmers model for the SSE-123 Example Subsystem.

Access definition

The programmers model follows the system address map rules that the *Arm®v8-M Architecture Reference Manual* defines.

To provide memory blocks and peripherals that can be mapped either as Secure or Non-secure using software, several address regions are aliased as the table in [3.2 Subsystem memory map on page 3-42](#) shows. Software can then choose to allocate each memory block, or peripheral, as Secure or Non-secure using protection controllers. The *Implementation Defined Attribution Unit* (IDAU) region column in the table specifies the Security, ID, and *Non-secure Callable* (NSC) settings for each region.

Except when stated, all accesses to unmapped regions of the memory result in bus error responses. An exception to that is when accessing unmapped address space within a region that a peripheral occupies. In this case, the access is *Read-As-Zero and Write-Ignored* (RAZ/WI). Any accesses that result in security violations return RAZ/WI.

The subsystem implements the following features for controlling access to the memory map:

SAU	Provides software configurable security attribution.
IDAU	Provides subsystem-defined security attribution.
MPU	Provides software-configurable memory protection.
MPC	Controls access to subsystem SRAM.
PPC	Controls access to subsystem peripherals.
Secure Privilege Control Register Block	Configuration for IDAU and PPC.
Non-secure Privilege Control Register Block	Configuration for PPC.

The following definitions are used in this section:

Security

NS	Non-secure access only.
S	Secure access only.
NSC	Non-secure callable access.
NSP	Non-secure privileged access only.
SP	Secure privilege access only.
ALL	All security types have access.

Access

RO	Read-only, and Write-Ignore.
WO	Write-only, and Read-As-Zero.
RW	Read and Write.
RAZ/WI	Read-As-Zero and Write-Ignore.

3.2 Subsystem memory map

This section describes the SSE-123 Example Subsystem memory map.

Access to specific regions is limited to only the processor and debug access interface. Accesses to those regions from any other master or expansion interface return a bus error. This behavior applies to the following regions:

- Processor I/O port.
- All devices in the processor private peripherals regions and debug APB expansion interface, region ID 50-56.

Accesses to reserved regions, that are private to the processor and debug access interface, do not return a bus error, but instead are RAZ/WI.

The following configuration options affect the memory map:

- When the Single-Cycle I/O port feature is not present, ‘Processor I/O Port’ regions are reserved and access to these regions results in a bus error.
- The NSCCFG configures the NSC values for Secure code regions.
- Programming of the *Memory Protection Controller (MPC)*, *Peripheral Protection Controller (PPC)*, and/or privilege control register blocks define the privileged and unprivileged accessibility. For information about devices with control of privilege level, see the following:
 - [3.3.3 Secure privilege control registers block on page 3-59](#).
 - [3.3.4 Non-secure privilege control registers block on page 3-77](#).

The following table shows the assignments of memory regions. The table includes the following information:

- IDAU decoding defining the security attribution of a memory region.
- Device aliasing defines which physical devices are aliased across Secure and Non-secure memory regions.

Note

When the table defines aliasing of expansion interfaces across Secure and Non-secure memory regions, these interfaces are not aliased at the interfaces, but expected to be aliased outside the subsystem. In addition, MPCs and PPCs should be connected for these regions, outside the subsystem, to selectively map memory blocks of peripherals between Secure and Non-secure regions.

Table 3-1 Subsystem memory region descriptions

Region ID	Address		Size	Region description	Alias with region ID	IDAU region values		
	From	To				Security	IDAUID	NSC
1	0x00000000	0x0DFFFFFF	224MB	AHB5 expansion master interface 0.	4	NS	0x0	0

3.3 Subsystem register descriptions

This section defines the registers in the SSE-123 memory map.

This section contains the following subsections:

- [3.3.1 Subsystem information registers block on page 3-46.](#)
- [3.3.2 Subsystem control registers block on page 3-48.](#)
- [3.3.3 Secure privilege control registers block on page 3-59.](#)
- [3.3.4 Non-secure privilege control registers block on page 3-77.](#)
- [3.3.5 Subsystem timers on page 3-81.](#)
- [3.3.6 Subsystem watchdogs on page 3-81.](#)
- [3.3.7 Power Policy Unit \(PPU\) on page 3-82.](#)
- [3.3.8 SRAM memory protection control on page 3-82.](#)
- [3.3.9 Cortex-M23 processor Private Peripheral Bus \(PPB\) on page 3-82.](#)

3.3.1 Subsystem information registers block

The SSE-123 information registers provide software information for hardware identification and configuration.

Power domain: **PD_SYS**.

Reset domain: **nHRESET**.

The following table shows the registers in the system information register block.

Table 3-2 Subsystem information register summary

Offset	Name	Type	Reset value	Description	Security
0x000	SYS_VERSION	RO	0x0004_1748	<i>SYS_VERSION, System Version register on page 3-46.</i>	All
0x004	SYS_CONFIG	RO	Depends on subsystem configuration.	<i>SYS_CONFIG, System Configuration register on page 3-47</i>	All
0x008 - 0xFCC	-	-	0x0000_0000	Reserved.	All
0xFD0	PIDR4	RO	0x0000_0004	Peripheral ID 4.	All
0xFD4	PIDR5	-	0x0000_0000	Reserved.	All
0xFD8	PIDR6	-	0x0000_0000	Reserved.	All
0xFDC	PIDR7	-	0x0000_0000	Reserved.	All
0xFE0	PIDR0	RO	0x0000_0058	Peripheral ID 0.	All
0xFE4	PIDR1	RO	0x0000_00B8	Peripheral ID 1.	All
0xFE8	PIDR2	RO	0x0000_000B	Peripheral ID 2.	All
0xFEC	PIDR3	RO	0x0000_0000	Peripheral ID 3.	All
0xFF0	CIDR0	RO	0x0000_000D	Component ID 0.	All
0xFF4	CIDR1	RO	0x0000_00F0	Component ID 1.	All
0xFF8	CIDR2	RO	0x0000_0005	Component ID 2.	All
0xFFC	CIDR3	RO	0x0000_00B1	Component ID 3.	All

SYS_VERSION, System Version register

The SYS_VERSION register shows the version of the subsystem.

The SYS_VERSION register characteristics are:

Usage constraints

This register is read-only.

Configurations

This register exists in all configurations.

Attributes

See [3.3.1 Subsystem information registers block on page 3-46](#).

The following table shows the bit assignments.

Table 3-3 SYS_VERSION register bit assignments

Bits	Name	Function
[31:28]	-	Reserved.
[27:24]	MAJOR_REVISION	Set to 0x0.
[23:20]	MINOR_REVISION	Set to 0x0.
[19:12]	DESIGNER_ID	Arm product with designer code 0x41
[11:0]	PART_NUMBER	Part number for the subsystem product.

SYS_CONFIG, System Configuration register

The SYS_CONFIG register reports the configuration of the subsystem.

The SYS_CONFIG register characteristics are:

Usage constraints

This register is read-only.

Configurations

This register exists in all configurations.

Attributes

See [3.3.1 Subsystem information registers block on page 3-46](#).

The following table shows the bit assignments.

Table 3-4 SYS_CONFIG register bit assignments

Bits	Name	Access	Width	Reset value	Description
[31:16]	-	RAZ/WI	16	0x00	Reserved.
[15:14]	DEBUG_MODE	RO	2	The level of debug features that were chosen during the configuration of the subsystem.	Debug functionality included: 0 No debug. 1 No trace. 2 Has trace.
[13]	IO_PORT_ENABLED	RO	1	If the Single I/O Port feature was enabled during the configuration of the subsystem, then the reset value is 0x1. Otherwise, the reset value is 0x0.	Processor I/O port enabled.

Table 3-4 SYS_CONFIG register bit assignments (continued)

Bits	Name	Access	Width	Reset value	Description
[12:9]	-	RAZ/WI	4	0x0	Reserved.
[8:4]	SRAM_ADDR_WIDTH	RO	5	The SRAM address width that was chosen during the configuration of the subsystem.	SRAM size available. Where $SRAM_SIZE = 2^{SRAM_ADDR_WIDTH}$ Valid range is 13-24 (8KB-16MB).
[3:0]	SRAM_NUM_BANK	RO	4	0x1	SRAM number of banks. Fixed in this subsystem and therefore always reads as 1 bank.

3.3.2 Subsystem control registers block

The subsystem control registers block implements registers for power, clocks, resets, and other general system control.

The subsystem control registers block is located in the following domains:

Power domain PD_AON

Reset domain nPORESET, nAONRESET, or nWARMAONRESET.

The following table shows the registers in the subsystem control register block. For Write-Access to these registers, only 32-bit writes are supported. Any byte or halfword writes result in the write data being ignored.

Table 3-5 Subsystem control register block

Offset	Name	Access	Reset value	Description	Security
0x000	SECDBGSTAT	RO	Defined by input signals	<i>SECDBGSTAT</i> , Secure Debug Status register on page 3-49, Secure debug configuration status register.	SP
0x004	SECDBGSET	WO	0x0000_0000	<i>SECDBGSET</i> , Secure Debug Set register on page 3-51, Secure debug configuration set register.	SP
0x008	SECDBGCLR	WO	0x0000_0000	<i>SECDBGCLR</i> , Secure Debug Clear register on page 3-51, Secure debug configuration clear register.	SP
0x00C	SCSECCTRL	RW	0x0000_0000	<i>SCSECCTRL</i> , System Control Security Control register on page 3-52.	SP

0xFF4	CIDR1	RO	0x0000_00F0	Component ID 1 register.	SP
0xFF8	CIDR2	RO	0x0000_0005	Component ID 2 register.	SP
0xFFC	CIDR3	RO	0x0000_00B1	Component ID 3 register.	SP

SECDBGSTAT, Secure Debug Status register

The Secure Debug Configuration registers are used to select the source value for the combined Secure Debug Authentication Signals, **DBGEN**, **NIDEN**, **SPIDEN**, and **SPNIDEN**.

For each signal, a selector is provided to select between an internal register value and the value on the boundary of the Subsystem.

Secure software can set or clear each value by setting the associated bit in the *SECDBGSET, Secure Debug Set register on page 3-51* or in the *SECDBGCLR, Secure Debug Clear register on page 3-51*, respectively. Secure software can read the system-wide value by reading the associated SECDBGSTAT register bit.

For example, the DBGEN_SEL register selects the source of the DBGEN value that is used in the system, where:

- If DBGEN_SEL is LOW, the **DBGENIN** input signal is used to define the system-wide DBGEN value.
- If DBGEN_SEL is HIGH, the internal register value for DBGEN is used to define the system-wide DBGEN value.

To set the DBGEN or DBGEN_SEL register values HIGH, write to the SECDBGSET register with DBGEN_SET or DBGEN_SEL_SET set to HIGH, respectively.

To set the DBGEN and DBGEN_SEL register values to LOW, write to the SECDBGCLR register with DBGEN_CLR or DBGEN_SEL_CLR set to HIGH, respectively.

To read the value of the selected DBGEN, read the SECDBGSTAT register for the DBGEN_SEL_STAT value.

The selected DBGEN register value is also made available to external expansion logic through the **DBGEN** output signal of the Subsystem.

Top-level Static Configuration signals, **DBGEN_SEL_DIS**, **NIDEN_SEL_DIS**, **SPIDEN_SEL_DIS**, and **SPNIDEN_SEL_DIS**, are provided to disable each of the selectors. Disabling the selectors forces the corresponding registers DBGEN_SEL_STATUS, NIDEN_SEL_STATUS, SPIDEN_SEL_STATUS, and SPNIDEN_SEL_STATUS to zero, forcing each respective input to use its external value.

This can be used to disable the ability for Secure firmware to modify or override the Debug Authentication value.

The reset domain is **nAONRESET**.

The SECDBGSTAT register characteristics are:

Usage constraints

This register is read-only.

Configurations

This register exists in all configurations.

Attributes

See [3.3.2 Subsystem control registers block on page 3-48](#).

The following table shows the bit assignments.

Table 3-6 SECDBGSTAT register bit assignments

Bits	Name	Access	Width	Reset value	Description
[31:8]	-	RAZ/WI	24	0x000000	Reserved.
[7]	SPNIDEN_SEL_STATUS	RO	1	0x0	Active-HIGH Secure privilege non-invasive debug enable selector value.
[6]	SPNIDEN_STATUS	RO	1	Input signal SPNIDENIN	Active-HIGH Secure privilege non-invasive debug enable value.
[5]	SPIDEN_SEL_STATUS	RO	1	0x0	Active-HIGH Secure privilege invasive debug enable selector value.
[4]	SPIDEN_STATUS	RO	1	Input signal SPIDENIN	Active-HIGH Secure privilege invasive debug enable value.
[3]	NIDEN_SEL_STATUS	RO	1	0x0	Active-HIGH non-invasive debug enable selector value.
[2]	NIDEN_STATUS	RO	1	Input signal NIDENIN	Active-HIGH non-invasive debug enable value.

Table 3-6 SECDBGSTAT register bit assignments (continued)

Bits	Name	Access	Width	Reset value	Description
[1]	DBGEN_SEL_STATUS	RO	1	0x0	Active-HIGH debug enable selector value.
[0]	DBGEN_STATUS	RO	1	Input signal DBGENIN	Active-HIGH debug enable value.

SECDBGSET, Secure Debug Set register

The Secure Debug Configuration registers are used to select the source value for the combined Secure Debug Authentication Signals, **DBGEN**, **NIDEN**, **SPIDEN**, and **SPNIDEN**.

See [SECDBGSTAT, Secure Debug Status register on page 3-49](#) for a description of this register.

The SECDBGSET register characteristics are:

Usage constraints

This register is write-only.

Configurations

This register exists in all configurations.

Attributes

See [3.3.2 Subsystem control registers block on page 3-48](#).

The following table shows the bit assignments.

Table 3-7 SECDBGSET register bit assignments

Bits	Name	Access	Width	Reset value	Description
[31:8]	-	RAZ/WI	24	0x000000	Reserved.
[7]	SPNIDEN_SEL_SET	WO	1	0x0	Active-HIGH Secure privilege non-invasive debug enable selector value.
[6]	SPNIDEN_SET	WO	1	0x0	Active-HIGH Secure privilege non-invasive debug enable value.
[5]	SPIDEN_SEL_SET	WO	1	0x0	Active-HIGH Secure privilege invasive debug enable selector value.
[4]	SPIDEN_SET	WO	1	0x0	Active-HIGH Secure privilege invasive debug enable value.
[3]	NIDEN_SEL_SET	WO	1	0x0	Active-HIGH non-invasive debug enable selector value.
[2]	NIDEN_SET	WO	1	0x0	Active-HIGH non-invasive debug enable value.
[1]	DBGEN_SEL_SET	WO	1	0x0	Active-HIGH debug enable selector value.
[0]	DBGEN_SET	WO	1	0x0	Active-HIGH debug enable value.

SECDBGCLR, Secure Debug Clear register

The Secure Debug Configuration registers are used to select the source value for the combined Secure Debug Authentication Signals, **DBGEN**, **NIDEN**, **SPIDEN**, and **SPNIDEN**.

See [SECDBGSTAT, Secure Debug Status register on page 3-49](#) for a description of this register.

The SECDBGCLR register characteristics are:

Usage constraints

This register is read-only.

Configurations

This register exists in all configurations.

Attributes

See [3.3.2 Subsystem control registers block on page 3-48](#).

The following table shows the bit assignments.

Table 3-8 SECDBGCLR register bit assignments

Bits	Name	Access	Width	Reset value	Description
[31:8]	-	RAZ/WI	24	0x000000	Reserved.
[7]	SPNIDEN_SEL_CLR	WO	1	0x0	Active-HIGH Secure privilege non-invasive debug enable selector value.
[6]	SPNIDEN_CLR	WO	1	0x0	Active-HIGH Secure privilege non-invasive debug enable value.
[5]	SPIDEN_SEL_CLR	WO	1	0x0	Active-HIGH Secure privilege invasive debug enable selector value.
[4]	SPIDEN_CLR	WO	1	0x0	Active-HIGH Secure privilege invasive debug enable value.
[3]	NIDEN_SEL_CLR	WO	1	0x0	Active-HIGH non-invasive debug enable selector value.
[2]	NIDEN_CLR	WO	1	0x0	Active-HIGH non-invasive debug enable value.
[1]	DBGEN_SEL_CLR	WO	1	0x0	Active-HIGH debug enable selector value.
[0]	DBGEN_CLR	WO	1	0x0	Active-HIGH debug enable value.

SCSECCTRL, System Control Security Control register

The SCSECCTRL register provides register bits to set the Secure configuration lock of this register block. It is located in the **nPORESET** reset domain.

The SCSECCTRL register characteristics are:

Usage constraints

This register is read-only.

Configurations

This register exists in all configurations.

Attributes

See [3.3.2 Subsystem control registers block on page 3-48](#).

The following table shows the bit assignments.

Table 3-9 SCSECCTRL register bit assignments

Bits	Name	Access	Width	Reset value	Description
[31:3]	-	RAZ/WI	29	0x00000000	Reserved.
[2]	SCSECCFGLOCK	RW. Write one to set. Write zero ignored.	1	0x0	Active-HIGH control to disable writes to security-related control registers in this register block. When set to HIGH, it can no longer be cleared to zero except by using a Power On Reset. When set to HIGH, Write-Access to SECDBGSET, SECDBGCLR, and INITVTOR are ignored.
[1:0]	-	RAZ/WI	2	0x0	Reserved.

CLOCK_CTRL, Clock Control register

The CLOCK_CTRL register enables software to control dynamic clock gating and dynamic clock switching behavior. By default, these power-saving features are not enabled. Software must set these features accordingly during boot to use the power-saving benefits.

The CLOCK_CTRL register characteristics are:

Usage constraints

This register is read/write.

Configurations

This register exists in all configurations.

Attributes

See [3.3.2 Subsystem control registers block on page 3-48](#).

The following table shows the bit assignments.

Table 3-10 CLOCK_CTRL register bit assignments

Bits	Name	Access	Width	Reset Value	Description
[31:18]	-	RAZ/WI	14	0x0000	Reserved.
[17:16]	FCLK_DCS_ENABLE	RW	2	0x0	Defines when dynamic clock switching is enabled for the FCLK domain: 2' b00 Dynamic clock switching is disabled. 2' b01 Dynamic clock switching is enabled when the Cortex-M23 processor core enters DEEPSLEEP. 2' b10 Dynamic clock switching is enabled when the subsystem enters the CSS.SLEEP power state. 2' b11 Reserved. Invalid state, dynamic clock switching is disabled.
[15:2]	-	RAZ/WI	14	0x0000	Reserved.

Table 3-10 CLOCK_CTRL register bit assignments (continued)

Bits	Name	Access	Width	Reset Value	Description
[1]	DCLK_FORCE	RW	1	0x1	Set this bit as follows: 0 Dynamic clock gating is enabled for the DCLK domain. 1 Dynamic clock gating is disabled for the DCLK domain.
[0]	HCLK_FORCE	RW	1	0x1	Set this bit as follows: 0 Dynamic clock gating is enabled for the HCLK domain. 1 Dynamic clock gating is disabled for the HCLK domain.

RESET_SYNDROME, Reset Syndrome register

The RESET_SYNDROME register stores the reason for the last reset event and either software or **nPORESET** clears this register. Writing zero clears all fields. Write one is ignored and maintains the previous value for that bit. The RESET_SYNDROME register is in the **nPORESET** reset domain.

Note

CPULOCKUP does not generate reset, but when HIGH, it indicates that the processor has locked-up. Locking-up could be a precursor to another reset event, for example, a watchdog timer reset request.

The RESET_SYNDROME register characteristics are:

Usage constraints

This register is read-only.

Configurations

This register exists in all configurations.

Attributes

See [3.3.2 Subsystem control registers block on page 3-48](#).

The following table shows the bit assignments.

Table 3-11 RESET_SYNDROME register bit assignments

Bits	Name	Access	Width	Reset value	Description
[31:10]	-	RAZ/WI	22	0x000000	Reserved.
[9]	SWRESETREQ	RW. Write zero to clear.	1	0x0	Software reset request.
[8]	HWRESETREQ		1	0x0	External hardware reset request.
[7]	-	RAZ/WI	1	0x0	Reserved.
[6]	CPULOCKUP	RW. Write zero to clear.	1	0x0	Processor lock-up status.
[5]	-	RAZ/WI	1	0x0	Reserved.
[4]	SYSRESETREQ	RW. Write zero to clear.	1	0x0	Processor System Reset Request, AIRCR.SYSRESETREQ.
[3]	-	RAZ/WI	1	0x0	Reserved.

Table 3-11 RESET_SYNDROME register bit assignments (continued)

Bits	Name	Access	Width	Reset value	Description
[2]	SWD	RW. Write zero to clear.	1	0x0	Secure watchdog.
[1]	NSWD		1	0x0	Non-secure watchdog.
[0]	PoR		1	0x1	Power-On.

RESET_MASK, Reset Mask register

The RESET_MASK register enables software to control the reset requests that can cause RESET. Set each bit HIGH to enable each source. The RESET_MASK register is in the **nWARM** AONRESET reset domain.

Note

Each mask bit, if cleared, prevents the reset source being used to generate the reset. Clearing mask bits also prevents the associated RESET_SYNDROME register bit from recording the event.

The RESET_MASK register characteristics are:

Usage constraints

This register is read-only.

Configurations

This register exists in all configurations.

Attributes

See [3.3.2 Subsystem control registers block on page 3-48](#).

The following table shows the bit assignments.

Table 3-12 RESET_MASK register bit assignments

Bits	Name	Access	Width	Reset value	Description
[31:5]	-	RAZ/WI	27	0x00000000	Reserved.
[4]	SYSRESETREQ_EN	RW	1	0x0	Enable AIRCR.SYSRESETREQ reset.
[3:2]	-	RAZ/WI	2	0x0	Reserved.
[1]	NSWD_EN	RW	1	0x0	Enable Non-secure watchdog reset.
[0]	-	RAZ/WI	1	0x0	Reserved.

SWRESET, Software Reset register

The SWRESET register enables software to request a system reset.

The SWRESET register characteristics are:

Usage constraints

This register is read-only.

Configurations

This register exists in all configurations.

Attributes

See [3.3.2 Subsystem control registers block on page 3-48](#).

The following table shows the bit assignments.

Table 3-13 SWRESET register bit assignments

Bits	Name	Access	Width	Reset value	Description
[31:10]	-	RAZ/WI	22	0x000000	Reserved.
[9]	SWRESETREQ	WO	1	0x0	Software reset request. Set HIGH to request a system reset that is equivalent to a watchdog or power-on reset.
[8:0]	-	RAZ/WI	9	0x0	Reserved.

GRETREG, General Purpose Retention register

The GRETREG register provides 16 bits of retention register for general storage, especially during power down of the rest of the system. The GRETREG register is in the **nAONRESET** GRETREG, General Purpose Retention register reset domain.

The GRETREG register characteristics are:

Usage constraints

This register is read/write.

Configurations

This register exists in all configurations.

Attributes

See [3.3.2 Subsystem control registers block on page 3-48](#).

The following table shows the bit assignments.

Table 3-14 GRETREG register bit assignments

Bits	Name	Access	Width	Reset value	Description
[31:16]	-	RAZ/WI	16	0x000000	Reserved.
[15:0]	GRETREG	RW	16	0x0000	General purpose retention register.

INITVTOR, Initial Secure Vector Table Offset register

The INITVTOR register defines the processor initial secure vector table offset, VTOR_S.TBLOFF[31:8], out of reset. The INITVTOR register is in the **nWARMAONRESET** reset domain.

The INITVTOR register characteristics are:

Usage constraints

This register is read/write.

Configurations

This register exists in all configurations.

Attributes

See [3.3.2 Subsystem control registers block on page 3-48](#).

The following table shows the bit assignments.

Table 3-15 INITVTOR register bit assignments

Bits	Name	Access	Width	Reset value	Description
[31:8]	INITVTOR	RW	24	INITVTOR_RST[23:0] input signal.	Default Secure vector table offset at reset for the processor.
[7:0]	-	RAZ/WI	8	-	Reserved.

CPUWAIT, CPU Wait register

The CPUWAIT register provides controls to force the processor to wait after reset rather than boot immediately. This forced waiting enables another entity in the expansion system or the debugger to access the system before the processor booting. The CPUWAIT register is in the **nPORESET** reset domain.

The CPUWAIT register characteristics are:

Usage constraints

This register is read/write.

Configurations

This register exists in all configurations.

Attributes

See [3.3.2 Subsystem control registers block on page 3-48](#).

The following table shows the bit assignments.

Table 3-16 CPUWAIT register bit assignments

Bits	Name	Access	Width	Reset value	Description
[31:1]	-	RAZ/WI	31	-	Reserved.
[0]	CPUWAIT	RW	1	CPUWAIT_RST input signal	<p>Processor waits at boot:</p> <p>0 Boot normally.</p> <p>1 Wait at boot.</p> <p>This register can be cleared to zero after reset when the CPUWAIT_CLR input signal is set HIGH, enabling the processor to boot after some setup has been completed external to the subsystem.</p> <p>See A.17 System control signals on page Appx-A-111.</p>

NMI_ENABLE, Non-Maskable Interrupt Enable register

The NMI_ENABLE register provides controls to enable or disable internally or externally generated *Non-Maskable Interrupt* (NMI) sources from generating an NMI interrupt on specific processor cores. Because this subsystem has only a single processor core, these registers are read-only and set to always enable the non-maskable interrupts. These registers are provided only for software compatibility with other IoT subsystems. The NMI_ENABLE register is in the **nAONRESET** reset domain.

The NMI_ENABLE register characteristics are:

Usage constraints

This register is read-only.

Configurations

This register exists in all configurations.

Attributes

See [3.3.2 Subsystem control registers block on page 3-48](#).

The following table shows the bit assignments.

Table 3-17 NMI_ENABLE register bit assignments

Bits	Name	Access	Width	Reset value	Description
[31:17]	-	RAZ/WI	15	-	Reserved.
[16]	EXTNMI_ENABLE	RO	1	1	Externally-sourced NMI enable. This bit determines whether the top-level pin, EXPNMI , can raise an NMI interrupt on the processor: HIGH Permitted. LOW Masked and not permitted.
[15:1]	-	RAZ/WI	15	-	Reserved.
[0]	INTNMI_ENABLE	RO	1	1	Internally-sourced NMI enable. This bit determines whether the subsystem internally generated NMI interrupt sources can raise an NMI interrupt on the processor: HIGH Permitted. LOW Masked and not permitted.

WICBRGCTRL, WIC Bridge Control register

The WICBRGCTRL register permits software to enable the *Wakeup Interrupt Controller* (WIC) bridge and read the status of the bridge. The WICBRGCTRL register is in the **nAONRESET** reset domain.

The WICBRGCTRL register characteristics are:

Usage constraints

This register is read/write.

Configurations

This register exists in all configurations.

Attributes

See [3.3.2 Subsystem control registers block on page 3-48](#).

The following table shows the bit assignments.

Table 3-18 WICBRGCTRL register bit assignments

Bits	Name	Access	Width	Reset value	Description
[31:9]	-	RAZ/WI	23	-	Reserved.
[8]	WICBRGEN_CLR	WO	1	0x0	WIC bridge enable clear. Writing '1' to this bit clears WICBRGEN_STATUS to LOW. This field always reads as '0'.

Table 3-18 WICBRGCTRL register bit assignments (continued)

Bits	Name	Access	Width	Reset value	Description
[7:5]	-	RAZ/WI	3	-	Reserved.
[4]	WICBRGEN_SET	WO	1	0x0	WIC bridge enable set. Writing '1' to this bit sets WICBRGEN_STATUS to HIGH. This field always reads as '0'.
[3:1]	-	RAZ/WI	3	-	Reserved.
[0]	WICBRGEN_STATUS	RO	1	0x0	WIC bridge enable status. When set HIGH using the WICBRGEN_SET register, enables the WIC bridge to isolate communication between the WIC and NVIC. For more information, see 2.3.7 Wakeup Interrupt Controller (WIC) and WIC-bridge on page 2-30.

3.3.3 Secure privilege control registers block

The Secure privilege control register block implements program-visible states that enable software to control security gating units within the design. These registers are Secure privileged access only and support 32-bit R/W accesses.

Power domain: **PD_SYS**.

Reset domain: **nHRESET**.

The following table shows the registers in the Secure privilege control registers block. For Write-Access to these registers, only 32-bit writes are supported. Any byte and halfword writes result in the write data being ignored.

Table 3-19 Secure privilege control registers block

Offset	Name	Access	Reset value	Description	Security
0x000	SPCSECCTRL	RW	0x0000_0000	SPCSECCTRL , Secure Privilege Controller Secure Configuration Control register on page 3-62.	SP
0x004	BUSWAIT	RW	0x0000_0000	BUSWAIT , Bus Access Wait register on page 3-62.	SP

SPCSECCTRL, Secure Privilege Controller Secure Configuration Control register

The SPCSECCTRL register implements the security lock register.

The SPCSECCTRL register characteristics are:

Usage constraints

This register is read/write.

Configurations

This register exists in all configurations.

Attributes

See [3.3.3 Secure privilege control registers block on page 3-59](#).

The following table shows the bit assignments.

Table 3-20 SPCSECCTRL register bit assignments

Bits	Name	Access	Width	Reset value	Description
[31:1]	-	RAZ/WI	31	-	Reserved.
[0]	SPCSECCFGLOCK	WO	1	0x0	Write '1' to set. Cleared by reset only. Disables writes to all security-related registers in the Secure privilege control registers block. When SPCSECCFGLOCK is set to HIGH, the following registers can no longer be modified until reset: <ul style="list-style-type: none"> • NSCCFG. • APBNSPPC. • APBSPPPC. • AHBNSPPCEXP. • AHBSPPPCEXP. • APBNSPPCEXP. • APBSPPPCEXP. • NSMSCEXP.

BUSWAIT, Bus Access Wait register

The BUSWAIT register enables software to indicate when the configuration of the MPCs or other Security registers is complete. This indication enables components outside the subsystem to gate access to the subsystem, for example, an AHB5 *Access Control Gate* (ACG) until the security settings have been applied.

The BUSWAIT register characteristics are:

Usage constraints

This register is read/write.

Configurations

This register exists in all configurations.

Attributes

See [3.3.3 Secure privilege control registers block on page 3-59](#).

The following table shows the bit assignments.

Table 3-21 BUSWAIT register bit assignments

Bits	Name	Access	Width	Reset value	Description
[31:17]	-	RAZ/WI	15	-	Reserved.
[16]	ACC_WAITN_STATUS	RO	1	0x0	<p>This status register indicates the status of any gating units that block bus access to the subsystem:</p> <p>0 Block access. 1 Allow access.</p> <p>The ACCWAITN_STAT input signal sets the status of this register.</p>
[15:1]	-	RAZ/WI	15	-	Reserved.
[0]	ACC_WAITN	RW	1	Defined by the ACC_WAITN_RST parameter. See the <i>Arm® SSE-123 Example Subsystem Configuration and Integration Manual</i> .	<p>Request gating units to block bus access to subsystem:</p> <p>0 Block access. 1 Allow access.</p> <p>This register drives the ACCWAITN output signal.</p>

SECRESPCFG, Security Violation Response Configuration register

The SECRESPCFG register is used to define a slave response to an access that causes a security violation in the subsystem.

The SECRESPCFG register characteristics are:

Usage constraints

This register is read/write.

Configurations

This register exists in all configurations.

Attributes

See [3.3.3 Secure privilege control registers block on page 3-59](#).

The following table shows the bit assignments.

Table 3-22 SECRESPCFG register bit assignments

Bits	Name	Access	Width	Reset value	Description
[31:1]	-	RAZ/WI	31	-	Reserved.
[0]	SECRESPCFG	RW	1	0x0	<p>This field configures the slave response if there is a security violation:</p> <p>0 Read-As-Zero, Write Ignore.</p> <p>1 Bus error.</p> <p>————— Note —————</p> <p>Some slaves, for example, the MPCs, provide their own control registers to configure their own response. These slaves do not depend on this control bit.</p>

NSCCFG, Non-Secure Callable Configuration register

The NSCCFG register enables software to define whether the Secure code region 0x1000_0000 to 0x1FFF_FFFF, and the Secure SRAM region 0x3000_0000 to 0x3FFF_FFFF are Non-secure callable regions of memory.

The NSCCFG register characteristics are:

Usage constraints

This register is read/write.

Configurations

This register exists in all configurations.

Attributes

See [3.3.3 Secure privilege control registers block on page 3-59](#).

The following table shows the bit assignments.

Table 3-23 NSCCFG register bit assignments

Bits	Name	Access	Width	Reset value	Description
[31:2]	-	RAZ/WI	30	-	Reserved.
[1]	RAMNSC	RW	1	0x0	<p>Configures whether the RAM region, 0x3000_0000 to 0x3FFF_FFFF is Non-secure callable:</p> <p>0 Not Non-secure callable.</p> <p>1 Non-secure callable.</p>
[0]	CODENSC	RW	1	0x0	<p>Configures whether the CODE region, 0x1000_0000 to 0x1FFF_FFFF, is Non-secure callable:</p> <p>0 Not Non-secure callable.</p> <p>1 Non-secure callable.</p>

SECMPCINTSTATUS, Secure MPC Interrupt Status register

The interrupt signals from the *Memory Protection Controller* (MPC), both within the subsystem and in the expansion logic, are merged and sent to the processor NVIC on a single interrupt signal. The Secure

MPC interrupt status register enables Secure software to check which MPC is causing the interrupt. When the source of the interrupt is identified, you must use the MPC register interface to clear the interrupt.

The SECMPCINTSTATUS register characteristics are:

Usage constraints

This register is read-only.

Configurations

This register exists in all configurations.

Attributes

See [3.3.3 Secure privilege control registers block on page 3-59](#).

The following table shows the bit assignments.

Table 3-24 SECMPCINTSTATUS register bit assignments

Bits	Name	Access	Width	Reset value	Description
[31:16]	S_MPCEXP_STATUS	RO	16	0x0000	Interrupt status for expansion memory protection controller. Each bit 'n' shows the status of the SMPCEXP_STAT[n] input signal. The MPCEXP_DIS parameter defines whether each bit within this register is implemented. See the <i>Arm® SSE-I23 Example Subsystem Configuration and Integration Manual</i> . If MPCEXP_DIS[n] = 1'b1, then SMPCEXP_STAT[n] is disabled and always reads as zeros.
[15:1]	-	RAZ/WI	15	-	Reserved.
[0]	S_MPCSRAM_STATUS	RO	1	0x0	Interrupt status for memory protection controller of SRAM.

SECPPCINTSTAT, Secure PPC Interrupt Status register

When access violations occur on any *Peripheral Protection Controller* (PPC), a level interrupt is raised using a combined interrupt to the processor *Nested Vector Interrupt Controller* (NVIC). The Secure PPC interrupt status, clear, and enable registers permit software to determine the source, clear, or mask the PPC interrupt.

The SECPPCINTSTAT register characteristics are:

Usage constraints

This register is read-only.

Configurations

This register exists in all configurations.

Attributes

See [3.3.3 Secure privilege control registers block on page 3-59](#).

The following table shows the bit assignments.

Table 3-25 SECPPCINTSTAT register bit assignments

Bits	Name	Access	Width	Reset value	Description
[31:24]	-	RAZ/WI	8	-	Reserved.
[23:20]	S_AHBPPCEXP_STATUS	RO	4	0x0	Interrupt status of the expansion peripheral protection controller for AHB slaves. Each bit 'n' shows the status of the SAHBPPCEXP_STAT[n] input signal.
[19:16]	-	RAZ/WI	4	-	Reserved.
[15:8]	-	RAZ/WI	8	-	Reserved.
[7:4]	S_APBPPCEXP_STATUS	RO	4	0x0	Interrupt status of expansion peripheral protection controller for APB slaves. Each bit 'n' shows the status of the SAPBPPCEXP_STAT[n] input signal.
[3:1]	-	RAZ/WI	3	-	Reserved.
[0]	S_APBPPCPERIP_STATUS	RO	1	0x0	Interrupt status of subsystem peripheral protection controller.

SECPPCINTCLR, Secure PPC Interrupt Clear register

When access violations occur on any *Peripheral Protection Controller* (PPC), a level interrupt is raised using a combined interrupt to the processor NVIC. The Secure PPC interrupt status, clear, and enable registers permit software to determine the source, clear, or mask the PPC interrupt.

The SECPPCINTCLR register characteristics are:

Usage constraints

This register is write-only.

Configurations

This register exists in all configurations.

Attributes

See [3.3.3 Secure privilege control registers block on page 3-59](#).

The following table shows the bit assignments.

Table 3-26 SECPPCINTCLR register bit assignments

Bits	Name	Access	Width	Reset value	Description
[31:24]	-	RAZ/WI	8	-	Reserved.
[23:20]	S_AHBPPCEXP_CLR	WO	4	0x0	Interrupt clear of the expansion peripheral protection controller for AHB slaves. Write '1' to clear. Automatically returns to '0' when the associated interrupt status clears. Each bit 'n' drives the SAHBPPCEXP_CLR[n] output signal.

Table 3-26 SECPPCINTCLR register bit assignments (continued)

Bits	Name	Access	Width	Reset value	Description
[19:16]	-	RAZ/WI	4	-	Reserved.
[15:8]	-	RAZ/WI	8	-	Reserved.
[7:4]	S_APBPPCEXP_CLR	WO	4	0x0	Interrupt clear of the expansion peripheral protection controller for APB slaves. Write '1' to clear. Automatically returns to '0' when the associated interrupt status clears. Each bit 'n' drives the SAPBPPCEXP_CLR[n] input signal.
[3:1]	-	RAZ/WI	3	-	Reserved.
[0]	S_APBPPCPERIP_CLR	WO	1	0x0	Interrupt clear of the subsystem peripheral protection controller. Write '1' to clear. Automatically returns to '0' when the associated interrupt status clears.

SECPPCINTEN, Secure PPC Interrupt Enable register

When access violations occur on any *Peripheral Protection Controller* (PPC), a level interrupt is raised using a combined interrupt to the processor *Nested Vector Interrupt Controller* (NVIC). The Secure PPC interrupt status, clear, and enable registers permit software to determine the source, clear, or mask the PPC interrupt.

The SECPPCINTEN register characteristics are:

Usage constraints

This register is read/write.

Configurations

This register exists in all configurations.

Attributes

See [3.3.3 Secure privilege control registers block on page 3-59](#).

The following table shows the bit assignments.

Table 3-27 SECPPCINTEN register bit assignments

Bits	Name	Access	Width	Reset value	Description
[31:24]	-	RAZ/WI	8	-	Reserved.
[23:20]	S_AHBPPCEXP_EN	RW	4	0x0	Interrupt enable of the expansion peripheral protection controller for AHB slaves. 0 Write '0' to mask this interrupt source. 1 Write '1' to enable this interrupt source. Each bit 'n' enables or disables SAHBPPCEXP_STAT[n] .

Table 3-27 SECPPCINTEN register bit assignments (continued)

Bits	Name	Access	Width	Reset value	Description
[19:16]	-	RAZ/WI	4	-	Reserved.
[15:8]	-	RAZ/WI	8	-	Reserved.
[7:4]	S_APBPPCEXP_EN	RW	4	0x0	<p>Interrupt enable of the expansion peripheral protection controller for APB slaves.</p> <p>0 Write '0' to mask this interrupt source.</p> <p>1 Write '1' to enable this interrupt source.</p> <p>Each bit 'n' enables or disables an interrupt from SAPBPPCEXP_STAT[n].</p>
[3:1]	-	RAZ/WI	3	-	Reserved.
[0]	S_APBPPCPERIP_EN	RW	1	0x0	<p>Interrupt enable of the subsystem peripheral protection controller.</p> <p>0 Write '0' to mask this interrupt source.</p> <p>1 Write '1' to enable this interrupt source.</p>

SECMSCINTSTAT, Secure MSC Interrupt Status register

When security violation occurs at any *Master Security Controller* (MSC) from outside the subsystem, in the expansion logic, an interrupt is raised using a combined interrupt to the processor *Nested Vector Interrupt Controller* (NVIC). The Secure MSC interrupt status, clear, and enable registers permit software to determine the source of the interrupt, clear the interrupt, and enable or disable (mask) the interrupt.

The SECMSCINTSTAT register characteristics are:

Usage constraints

This register is read-only.

Configurations

This register exists in all configurations.

Attributes

See [3.3.3 Secure privilege control registers block on page 3-59](#).

The following table shows the bit assignments.

Table 3-28 SECMSCINTSTAT register bit assignments

Bits	Name	Access	Width	Reset value	Description
[31:16]	S_MSCEXP_STATUS	RO	16	0x0000	<p>Interrupt status for expansion MSC.</p> <p>Each bit 'n' shows the status of the SMSCEXP_STAT[n] input signal.</p> <p>The MSCEXP_DIS parameter defines whether each bit within this register is implemented. See the <i>Arm® SSE-123 Example Subsystem Configuration and Integration Manual</i>.</p> <p>If MSCEXP_DIS[n] = 1'b1, then SMSCEXP_STAT[n] is disabled and always reads as zero.</p>
[15:0]	-	RAZ/WI	16	-	Reserved.

SECMSCINTCLR, Secure MSC Interrupt Clear register

When security violation occurs at any *Master Security Controller* (MSC) from outside the subsystem, in the expansion logic, an interrupt is raised using a combined interrupt to the processor *Nested Vector Interrupt Controller* (NVIC). The Secure MSC interrupt status, clear, and enable registers permit software to determine the source of the interrupt, clear the interrupt, and enable or disable (mask) the interrupt.

The SECMSCINTCLR register characteristics are:

Usage constraints

This register is write-only.

Configurations

This register exists in all configurations.

Attributes

See [3.3.3 Secure privilege control registers block on page 3-59](#).

The following table shows the bit assignments.

Table 3-29 SECMSCINTCLR register bit assignments

Bits	Name	Access	Width	Reset value	Description
[31:16]	S_MSCEXP_CLR	WO	16	0x0000	<p>Interrupt clear for expansion MSC.</p> <p>Each bit 'n' drives the SMSCEXP_CLR[n] output signal.</p> <p>Write '1' to clear. Automatically returns to '0' when the associated interrupt status clears.</p> <p>The MSCEXP_DIS parameter defines whether each bit in this register is implemented. See the <i>Arm® SSE-123 Example Subsystem Configuration and Integration Manual</i>.</p> <p>If MSCEXP_DIS[n] = 1'b1, then SMSCEXP_CLR[n] is disabled and any writes to it are ignored.</p>
[15:0]	-	RAZ/WI	16	-	Reserved.

SECMSCINTEN, Secure MSC Interrupt Enable register

When security violation occurs at any *Master Security Controller* (MSC) from outside the subsystem, in the expansion logic, an interrupt is raised using a combined interrupt to the processor *Nested Vector Interrupt Controller* (NVIC). The Secure MSC interrupt status, clear, and enable registers permit software to determine the source of the interrupt, clear the interrupt, and enable or disable (mask) the interrupt.

The SECMSCINTEN register characteristics are:

Usage constraints

This register is read-write.

Configurations

This register exists in all configurations.

Attributes

See [3.3.3 Secure privilege control registers block on page 3-59](#).

The following table shows the bit assignments.

Table 3-30 SECMSCINTEN register bit assignments

Bits	Name	Access	Width	Reset value	Description
[31:16]	S_MSCEXP_EN	RW	16	0x0000	Interrupt enable for expansion MSC. Each bit 'n' enables or disables the SMSCEXP_STAT[n] input interrupt signal. The MSCEXP_DIS parameter defines whether each bit within this register is implemented. See the <i>Arm® SSE-123 Example Subsystem Configuration and Integration Manual</i> . If MSCEXP_DIS[n] = 1 'b1 , then SMSCEXP_EN[n] is disabled and any writes to it are ignored.
[15:0]	-	RAZ/WI	16	-	Reserved.

BRGINTSTAT, Bridge Interrupt Status register

The expansion logic might contain AHB bridges that are necessary to handle clock domain crossing. To improve system performance, some of these bridges can buffer write data, and complete a write access on their slave interfaces before any potential error response is received for the Write-Access on their master interfaces. When this occurs, these bridges can raise a combined interrupt to the processor *Nested Vector Interrupt Controller* (NVIC). The bridge buffer error interrupt status, clear, and enable registers permit software to determine source of the interrupt, clear the interrupt, and enable or disable (mask), the interrupt.

The BRGINTSTAT register characteristics are:

Usage constraints

This register is read-only.

Configurations

This register exists in all configurations.

Attributes

See [3.3.3 Secure privilege control registers block on page 3-59](#).

The following table shows the bit assignments.

Table 3-31 BRGINTSTAT register bit assignments

Bits	Name	Access	Width	Reset value	Description
[31:16]	BRGEXP_STATUS	RO	16	0x0000	<p>Interrupt status for expansion bridge buffer error.</p> <p>Each bit 'n' shows the status of the BRGEXP_STAT[n] input signal.</p> <p>The BRGEXP_DIS parameter defines whether each bit within this register is implemented. See the <i>Arm® SSE-I23 Example Subsystem Configuration and Integration Manual</i>.</p> <p>If BRGEXP_DIS[n] = 1 'b1, then BRGEXP_STAT[n] is disabled and always reads as zero.</p>
[15:0]	-	RAZ/WI	16	-	Reserved.

BRGINTCLR, Bridge Interrupt Clear register

The expansion logic might contain AHB bridges that are necessary to handle clock domain crossing. To improve system performance, some of these bridges can buffer write data, and complete a Write-Access on their slave interfaces before any potential error response is received for the Write-Access on their master interfaces. When this occurs, these bridges can raise a combined interrupt to the processor *Nested Vector Interrupt Controller* (NVIC). The bridge buffer error interrupt status, clear, and enable registers permit software to determine the source of the interrupt, clear the interrupt, and enable or disable (mask), the interrupt.

The BRGINTCLR register characteristics are:

Usage constraints

This register is write-only.

Configurations

This register exists in all configurations.

Attributes

See [3.3.3 Secure privilege control registers block](#) on page 3-59.

The following table shows the bit assignments.

Table 3-32 BRGINTCLR register bit assignments

Bits	Name	Access	Width	Reset value	Description
[31:16]	BRGEXP_CLR	WO	16	0x0000	<p>Interrupt clear for expansion bridge buffer error.</p> <p>Each bit 'n' drives the BRGEXP_CLR[n] output signal.</p> <p>Write '1' to clear. Automatically returns to '0' when the associated interrupt status clears.</p> <p>The BRGEXP_DIS parameter defines whether each bit within this register is implemented. See the <i>Arm® SSE-123 Example Subsystem Configuration and Integration Manual</i>.</p> <p>If BRGEXP_DIS[n] = 1'b1, then BRGEXP_CLR[n] is disabled and any writes to it are ignored.</p>
[15:0]	-	RAZ/WI	16	-	Reserved.

BRGINTEN, Bridge Interrupt Enable register

The expansion logic might contain AHB bridges that are necessary to handle clock domain crossing. To improve system performance, some of these bridges can buffer write data, and complete a Write-Access on their slave interfaces before any potential error response is received for the Write-Access on their master interfaces. When this occurs, these bridges can raise a combined interrupt to the processor *Nested Vector Interrupt Controller* (NVIC). The bridge buffer error interrupt status, clear, and enable registers permit software to determine source of the interrupt, clear the interrupt, and enable or disable (mask), the interrupt.

The BRGINTEN register characteristics are:

Usage constraints

This register is read/write.

Configurations

This register exists in all configurations.

Attributes

See [3.3.3 Secure privilege control registers block on page 3-59](#).

The following table shows the bit assignments.

Table 3-33 BRGINTEN register bit assignments

Bits	Name	Access	Width	Reset value	Description
[31:16]	BRGEXP_EN	RW	16	0x0000	<p>Interrupt enable for expansion bridge buffer error.</p> <p>Each bit 'n' enables or disables the BRGEXP_STAT[n] input interrupt signal.</p> <p>The BRGEXP_DIS parameter defines whether each bit in this register is implemented. See the <i>Arm® SSE-123 Example Subsystem Configuration and Integration Manual</i>.</p> <p>If BRGEXP_DIS[n] = 1'b1, then BRGEXP_EN[n] is disabled and any writes to it are ignored.</p>
[15:0]	-	RAZ/WI	16	-	Reserved.

AHBNSPPCEXP, AHB Non-Secure Access PPC Expansion register

The AHBNSPPCEXP register permits software to configure each AHB peripheral using an AHB PPC in the expansion subsystem outside the SSE-123 Example Subsystem.

Each field defines the Secure or Non-secure access setting for an associated peripheral, as follows:

- 0 Permit Secure access only. Non-secure access is not permitted.
- 1 Permit Non-secure access only. Secure access is not permitted.

These settings directly control the expansion signals on the security control expansion interface.

The AHBNSPPCEXP register characteristics are:

Usage constraints

This register is read/write.

Configurations

This register exists in all configurations.

Attributes

See [3.3.3 Secure privilege control registers block on page 3-59](#).

The following table shows the bit assignments.

Table 3-34 AHBNSPPCEXP register bit assignments

Bits	Name	Access	Width	Reset value	Description
[31:16]	-	RAZ/WI	16	-	Reserved.
[15:0]	AHBNSPPCEXP	RW	16	0x0000	Expansion Non-secure access AHB slave peripheral protection control. Each bit 'n' drives the AHBNSPPCEXP[n] output signal. The AHBNSPPCEXP_DIS parameter defines whether each bit in this register is implemented. See the <i>Arm® SSE-123 Example Subsystem Configuration and Integration Manual</i> . If AHBNSPPCEXP_DIS[n] = 1'b1, then AHBNSPPCEXP[n] is disabled, reads as zeros, and any writes to it are ignored.

APBNSPPC, APB Non-secure Access PPC register

The APBNSPPC register permits software to configure whether each APB peripheral that it controls using an APB *Peripheral Protection Control* (PPC) is Secure access only or is Non-secure access only.

Each field defines the Secure or Non-secure access setting for an associated peripheral, as follows:

- 0 Permit Secure access only. Non-secure access is not permitted.
- 1 Permit Non-secure access only. Secure access is not permitted.

The APBNSPPC register characteristics are:

Usage constraints

This register is read/write.

Configurations

This register exists in all configurations.

Attributes

See [3.3.3 Secure privilege control registers block on page 3-59](#).

The following table shows the bit assignments.

Table 3-35 APBNSPPC register bit assignments

Bits	Name	Access	Width	Reset value	Description
[31:2]	-	RAZ/WI	30		Reserved.
[1]	NS_TIMER1	RW	1	0x0	Subsystem timer 1 APB access security setting.
[0]	NS_TIMER0	RW	1	0x0	Subsystem timer 0 APB access security setting.

APBNSPPCEXP0, APBNSPPCEXP1, APBNSPPCEXP2, and APBNSPPCEXP3, APB Non-Secure Access PPC Expansion registers

The APBNSPPCEXPx registers permits software to configure each APB peripheral using an APB *Peripheral Protection Controller* (PPC) in the expansion subsystem outside the SSE-123 Example Subsystem.

Each field defines the Secure or Non-secure access setting for an associated peripheral, as follows:

- 0 Permit Secure access only. Non-secure access is not permitted.
- 1 Permit Non-secure access only. Secure access is not permitted.

These settings directly control the expansion signals on the security control expansion interface. All four registers have the same controls, where X is from 0-3.

The APBNSPPCEXP0, APBNSPPCEXP1, APBNSPPCEXP2, and APBNSPPCEXP3 register characteristics are:

Usage constraints

These registers are read/write.

Configurations

This register exists in all configurations.

Attributes

See [3.3.3 Secure privilege control registers block on page 3-59](#).

The following table shows the bit assignments.

Table 3-36 APBNSPPCEXP0, APBNSPPCEXP1, APBNSPPCEXP2, and APBNSPPCEXP3 register bit assignments

Bits	Name	Access	Width	Reset value	Description
[31:16]	-	RAZ/WI	16	-	Reserved.
[15:0]	APBNSPPCEXP<X>	RW	16	0x0000	<p>Expansion Non-secure access APB slave peripheral protection control.</p> <p>Each bit 'n' drives the APBNSPPCEXP<X>[n] output signal and controls the selection of APBPPCEXP<X>[n].</p> <p>The APBPPCEXP<X>_DIS parameter defines whether each bit in this register is implemented. See the <i>Arm® SSE-123 Example Subsystem Configuration and Integration Manual</i>.</p> <p>If APBPPCEXP<X>_DIS[n] = 1'b1, then APBNSPPCEXP<X>[n] is disabled, reads as zeros, and any writes to it are ignored.</p>

AHBSPPCEXP, AHB Secure Privilege Access PPC Expansion register

The AHBSPPCEXP register permits software to configure Secure privilege access permissions of external AHB peripherals using an AHB *Peripheral Protection Controller* (PPC) located in the expansion area outside the SSE-123 Example Subsystem

Each field defines the Secure privileged or Secure unprivileged access setting for an associated peripheral, as follows:

- 0 Permit Secure privileged access only.
- 1 Permit Secure unprivileged and privileged access.

The AHBSPPCEXP register characteristics are:

Usage constraints This register is read/write.

Configurations This register exists in all configurations.

Attributes See [3.3.3 Secure privilege control registers block on page 3-59](#).

The following table shows the bit assignments.

Table 3-37 AHBSPPCEXP register bit assignments

Bits	Name	Access	Width	Reset value	Description
[31:16]	-	RAZ/WI	16	-	Reserved.
[15:0]	AHBSPPCEXP	RW	16	0x0000	<p>Expansion Secure privilege access AHB slave peripheral protection control.</p> <p>Each bit 'n' drives the AHBSPPCEXP[n] output signal.</p> <p>The AHBPPCEXP_DIS parameter defines whether each bit in this register is implemented. See the <i>Arm® SSE-123 Example Subsystem Configuration and Integration Manual</i>.</p> <p>If AHBPPCEXP_DIS[n] = 1'b1, then AHBSPPCEXP[n] is disabled, reads as zeros, and any writes to it are ignored.</p>

APBSPPPC, APB Secure Privilege Access PPC register

The APBSPPPC register permits software to configure secure privilege access permissions for APB peripherals using an APB *Peripheral Protection Controller* (PPC).

Each field defines the Secure privileged or Secure unprivileged access setting for an associated peripheral, as follows:

- 0 Permit Secure privileged access only.
- 1 Permit Secure unprivileged and privileged access.

The APBSPPPC register characteristics are:

Usage constraints This register is read/write.

Configurations This register exists in all configurations.

Attributes See [3.3.3 Secure privilege control registers block on page 3-59](#).

The following table shows the bit assignments.

Table 3-38 APBSPPPC register bit assignments

Bits	Name	Access	Width	Reset value	Description
[31:7]	-	RAZ/WI	25	-	Reserved.
[6]	SP_WATCHDOG	RW	1	0x0	APB access secure privileged setting for subsystem watchdog refresh frame.
[5:2]	-	RAZ/WI	4	-	Reserved.
[1]	SP_TIMER1	RW	1	0x0	APB access secure privileged setting for subsystem timer 1.
[0]	SP_TIMER0	RW	1	0x0	APB access secure privileged setting for subsystem timer 0.

APBSPPPCEXP0, APBSPPPCEXP1, APBSPPPCEXP2, and APBSPPPCEXP3, APB Secure Privilege Access PPC Expansion registers

The APBSPPPCEXPx register permits software to configure secure privilege access permissions of external APB peripherals using an APB *Peripheral Protection Controller* (PPC) that are located in the expansion area outside the SSE-123 Example Subsystem.

Each field defines the Secure privileged or Secure unprivileged access setting for an associated peripheral, as follows:

- 0 Permit Secure privileged access only.
- 1 Permit Secure unprivileged and privileged access.

These settings directly control the expansion signals on the security control expansion interface. All four registers have the same controls, where X is 0-3.

The APBSPPPCEXP0, APBSPPPCEXP1, APBSPPPCEXP2, and APBSPPPCEXP3 registers characteristics are:

Usage constraints These registers are read/write.

Configurations This register exists in all configurations.

Attributes See [3.3.3 Secure privilege control registers block on page 3-59](#).

The following table shows the bit assignments.

Table 3-39 APBSPPPCEXP0, APBSPPPCEXP1, APBSPPPCEXP2, APBSPPPCEXP3 registers bit assignments

Bits	Name	Access	Width	Reset value	Description
[31:16]	-	RAZ/WI	16	-	Reserved.
[15:0]	APBSPPPCEXP<X>	RW	16	0x0000	<p>Expansion secure privilege access APB slave peripheral protection control.</p> <p>Each bit 'n' drives the APBPPPCEXP<X>[n] output signal when the corresponding bit APBNSPPPCEXP<X>[n] is set LOW.</p> <p>The APBPPPCEXP<X>_DIS parameter defines whether each bit within this register is implemented. See the <i>Arm® SSE-123 Example Subsystem Configuration and Integration Manual</i>.</p> <p>If APBPPPCEXP<X>_DIS[n] = 1'b1, then APBSPPPCEXP<X>[n] is disabled, reads as zeros, and any writes to it are ignored.</p>

NSMSCEXP, Non-Secure Access MSC Expansion register

The NSMSCEXP register enables software to configure whether each master that is located behind each *Master Security Controller* (MSC) in the expansion subsystem is a Secure or Non-secure device.

The NSMSCEXP register characteristics are:

Usage constraints This register is read/write.

Configurations This register exists in all configurations.

Attributes See [3.3.3 Secure privilege control registers block on page 3-59](#).

The following table shows the bit assignments.

Table 3-40 NSMSCEXP register bit assignments

Bits	Name	Access	Width	Reset value	Description
[31:16]	NS_MSCEXP	RW	16	0x0000	<p>Expansion MSC Non-secure configuration.</p> <p>Each bit 'n' controls the Non-secure configuration of each MSC and drives the NS_MSCEXP[n] signals.</p> <p>Set to HIGH to define a master as Non-secure. Otherwise, it is Secure.</p> <p>The MSCEXP_DIS[n] parameter defines whether each bit in this register is implemented. See the <i>Arm® SSE-123 Example Subsystem Configuration and Integration Manual</i>.</p> <p>If MSCEXP_DIS[n] = 1'b1, then NS_MSCEXP[n] is disabled, reads as zeros, and any writes to it are ignored.</p>
[15:0]	-	RAZ/WI	16	-	Reserved.

3.3.4 Non-secure privilege control registers block

The Non-secure privilege control block implements program-visible states that permit software to control various security gating units within the design.

Power domain: **nPD_SYS**.

Reset domain: **nHRESET**.

The following table shows the registers in the Non-secure privilege control block. For write access to these registers, only 32-bit writes are supported. Any byte and halfword writes result in the write data being ignored.

Table 3-41 Non-secure privilege control registers block

Offset	Name	Access	Reset value	Description	Security
0x000-0x08C	-	RAZ/WI	0x0000_0000	Reserved.	NSP

AHBNSPPPCEXP, AHB Non-Secure Privilege Access PPC Expansion register

The AHBNSPPPCEXP register permits software to configure Non-secure privileged access permissions of external AHB peripherals using an AHB *Peripheral Protection Controller* (PPC) that is located in the expansion area outside the SSE-123 Example Subsystem.

Each field defines the Non-secure privileged or Non-secure unprivileged access setting for an associated peripheral, as follows:

- 0 Permit Non-secure privileged access only.
- 1 Permit Non-secure unprivileged and privileged access.

The AHBNSPPPCEXP register characteristics are:

Usage constraints This register is read/write.

Configurations This register exists in all configurations.

Attributes See [3.3.4 Non-secure privilege control registers block on page 3-77](#).

The following table shows the bit assignments.

Table 3-42 AHBNSPPPCEXP register bit assignments

Bits	Name	Access	Width	Reset value	Description
[31:16]	-	RAZ/WI	16	-	Reserved
[15:0]	AHBNSPPPCEXP	RW	16	0x0000	Expansion Non-secure privilege access AHB slave Peripheral Protection Control. Each bit 'n' drives the AHBNSPPPCEXP[n] output signal. The AHBPPPCEXP_DIS parameter defines whether each bit within this register is implemented. See the <i>Arm® SSE-123 Example Subsystem Configuration and Integration Manual</i> . If AHBPPPCEXP_DIS[n] = 1'b1 then AHBNSPPPCEXP[n] is disabled, reads as zeros, and any writes to it are ignored.

APBNSPPPC, APB Non-Secure Privilege Access PPC register

The APBNSPPPC register permits software to configure Non-secure privilege access permissions of APB peripherals using an APB PPC.

Each field defines the Non-secure privileged or Non-secure unprivileged access setting for an associated peripheral, as follows:

- 0 Permit Non-secure privileged access only.
- 1 Permit Non-secure unprivileged and privileged access.

The APBNSPPPC register characteristics are:

Usage constraints This register is read/write.

Configurations This register exists in all configurations.

Attributes See [3.3.4 Non-secure privilege control registers block on page 3-77](#).

The following table shows the bit assignments.

Table 3-43 APBNSPPPC register bit assignments

Bits	Name	Access	Width	Reset value	Description
[31:7]	-	RAZ/WI	25	-	Reserved.
[6]	NSP_WATCHDOG	RW	1	0x0	APB access Non-secure privileged setting for subsystem watchdog refresh frame.
[5:2]	-	RAZ/WI	4	-	Reserved.
[1]	NSP_TIMER1	RW	1	0x0	APB access Non-secure privileged setting for subsystem timer 1.
[0]	NSP_TIMER0	RW	1	0x0	APB access Non-secure privileged setting for subsystem timer 0.

APBNSPPPCEXP0, APBNSPPPCEXP1, APBNSPPPCEXP2, and APBNSPPPCEXP3, APB Non-Secure Privilege PPC Expansion registers

The APBNSPPPCEXPx register permits software to configure Non-secure privileged access permissions of external APB peripherals using an APB *Peripheral Protection Controller* (PPC) that is located in the expansion area outside the SSE-123 Example Subsystem.

Each field defines the Non-secure privileged or Non-secure unprivileged access setting for an associated peripheral, as follows:

- 0 Permit Non-secure privileged access only.
- 1 Permit Non-secure unprivileged and privileged access.

All four registers have the same controls, where X is from 0-3.

The APBNSPPPCEXP0, APBNSPPPCEXP1, APBNSPPPCEXP2, and APBNSPPPCEXP3 registers characteristics are:

Usage constraints This register is read/write.

Configurations This register exists in all configurations.

Attributes See [3.3.4 Non-secure privilege control registers block on page 3-77](#).

The following table shows the bit assignments.

Table 3-44 APBNSPPPCEXPx register bit assignments

Bits	Name	Access	Width	Reset value	Description
[31:16]	-	RAZ/WI	16		Reserved.
[15:0]	APBNSPPPCEXP<X>	RW	16	0x0000	<p>Expansion Non-secure privilege access AHB slave Peripheral Protection Control.</p> <p>Each bit 'n' drives the APBPPPCEXP<X> [n] output signal when the corresponding APBNSPPPCEXP<X>[n] bit is set LOW.</p> <p>The APBPPPCEXP_DIS<X> parameter defines whether each bit within this register is implemented. See the <i>Arm® SSE-123 Example Subsystem Configuration and Integration Manual</i>.</p> <p>If APBPPPCEXP_DIS<X>[n] = 1'b1 then APBNSPPPCEXP<X>[n] is disabled, reads as zeros, and any writes to it are ignored.</p>

3.3.5 Subsystem timers

This section describes the subsystem timers in the SSE-123 Example Subsystem.

The subsystem timers are located in the following domains:

Power domain **PD_AON.**

Reset domain **nAONRESET.**

Each subsystem timer contains a single 4KB register frame that is aliased to Secure and Non-secure:

- The *APBNSPPPC, APB Non-secure Access PPC register on page 3-73* controls the security access control of both timers.
- Both timers can be given privileged or non-privileged access.

The following registers control the privilege level of both timers:

- *APBSPPPC, APB Secure Privilege Access PPC register on page 3-76.*
- *APBNSPPPC, APB Non-Secure Privilege Access PPC register on page 3-79.*

For information about the subsystem timers registers, see *B.3 System Timer on page Appx-B-123*.

3.3.6 Subsystem watchdogs

This section describes the subsystem watchdogs in the SSE-123 Example Subsystem.

The subsystem watchdogs are located in the following domains:

Power domain **PD_AON.**

Reset domain **nWARMAONRESET.**

Each subsystem watchdog contains two 4KB register frames that are permanently mapped to either the Secure or Non-secure:

The control frame of each watchdog is privileged access only.

The *APBSPPPC, APB Secure Privilege Access PPC register on page 3-76* and *APBNSPPPC, APB Non-Secure Privilege Access PPC register on page 3-79* control whether the refresh frame of each watchdog is privileged or non-privileged access.

For more information about the subsystem watchdog registers, see *B.4 System Watchdog on page Appx-B-130*.

3.3.7 Power Policy Unit (PPU)

This section describes the *Power Policy Unit* (PPU) in the SSE-123 Example Subsystem. The SSE-123 Subsystem integrates CoreLink PCK-600 Power Control Kit PPU components to enable software to manage power control of the subsystem. See the .

SYS PPU

The SYS PPU is located in the following domains:

Power domain	PD_AON.
Reset domain	nAONRESET.

Specific programming of the SYS PPU can cause the subsystem to deadlock. The programming includes:

- Any write to the PPU_PWPR.OP_DYN_EN register bit of the SYS PPU to change to a static power mode.
- Any write to the PPU.PWCR.PWR_DEVACTIVEEN register bit of the SYS PPU to disable **DEVACTIVE** inputs.

The SSE-123 Example Subsystem does not support use of the WARM_RST power mode. For information about Warm reset behavior, see [2.2.3 Reset control on page 2-26](#).

For information about SYS PPU registers, see the *Arm® Power Policy Unit Version 1.1 Architecture Specification*.

3.3.8 SRAM memory protection control

This section describes SRAM memory protection control in the SSE-123 Example Subsystem.

The SRAM memory protection control unit is located in the following domains:

Power domain	PD_SYS.
Reset domain	nHRESET.

For information about the SRAM MPC registers, see the *Arm® CoreLink™ SIE-200 System IP for Embedded Technical Reference Manual*.

3.3.9 Cortex-M23 processor Private Peripheral Bus (PPB)

This section describes Cortex-M23 *Private Peripheral Bus* (PPB) in the SSE-123 Example Subsystem.

The Cortex-M23 PPB is located in the following domains:

Power domain	PD_SYS.
Reset domain	nCOREHRESET.

For information about the Cortex-M23 PPB registers, see the following:

- *Arm®v8-M Architecture Reference Manual, Chapter D1 Register Specification.*
- *Arm® Cortex®-M23 Processor Technical Reference Manual.*

3.4 Subsystem interrupt map

Interrupt sources are routed to the Cortex-M23 processor *Nested Vector Interrupt Controller* (NVIC). All interrupts are also routed to the *Wakeup Interrupt Controller* (WIC) to be used as wakeup sources.

The options that you choose when configuring the SSE-123 Example Subsystem enable you to define the number of interrupts, and selectively enable them. You can also configure the WIC to define how many of the interrupts can be used as wakeup sources for the subsystem.

See the *Arm® SSE-123 Example Subsystem Configuration and Integration Manual*.

The following table shows the interrupt sources that are routed to the Cortex-M23 processor NVIC.

Table 3-45 Subsystem interrupt map

Interrupt input	Interrupt source
NMI	Combined: <ul style="list-style-type: none"> Secure watchdog interrupt. Expansion NMI.
IRQ[0]	Non-secure watchdog reset request.
IRQ[1]	Non-secure watchdog interrupt.
IRQ[2]	Reserved, disabled.
IRQ[3]	System timer 0.
IRQ[4]	System timer 1.
IRQ[5]	Reserved, disabled.
IRQ[6]	CTI IRQ request 0.
IRQ[7]	CTI IRQ request 1.
IRQ[8]	Reserved, disabled.
IRQ[9]	Combined: <ul style="list-style-type: none"> Subsystem SRAM MPC security violation. Expansion MPC security violation 0-15.
IRQ[10]	Combined: <ul style="list-style-type: none"> Subsystem peripherals PPC security violation. Expansion APB PPC security violation 0-3. Expansion AHB PPC security violation 0-3.
IRQ[11]	Combined expansion MSC security violation 0-15.
IRQ[12]	Combined expansion bridge buffer error 0-15.
IRQ[13]	Reserved, disabled.
IRQ[14]	Reserved, disabled.
IRQ[15]	PD_SYS PPU.
IRQ[16-239] ^a	Expansion IRQ.

^a The number of Expansion IRQ lines that are implemented depends on the configuration of the SSE-123 Example Subsystem.

Appendix A

Signal descriptions

This appendix describes the SSE-123 Example Subsystem external signals.

It contains the following sections:

- [A.1 Clock signals on page Appx-A-85.](#)
- [A.2 Reset signals on page Appx-A-86.](#)
- [A.3 Clock control interface signals on page Appx-A-87.](#)
- [A.4 HCLK clock Q-Channel signals on page Appx-A-88.](#)
- [A.5 DCLK clock Q-Channel signals on page Appx-A-89.](#)
- [A.6 Entry delay signals on page Appx-A-90.](#)
- [A.7 Clock enable signals on page Appx-A-91.](#)
- [A.8 Reset control interface signals on page Appx-A-92.](#)
- [A.9 Power control interfaces on page Appx-A-93.](#)
- [A.10 Expansion interfaces on page Appx-A-95.](#)
- [A.11 Interrupt signals on page Appx-A-100.](#)
- [A.12 Timestamp signals on page Appx-A-101.](#)
- [A.13 Event signals on page Appx-A-102.](#)
- [A.14 Debug interfaces on page Appx-A-103.](#)
- [A.15 Security control expansion signals on page Appx-A-107.](#)
- [A.16 Static configuration signals on page Appx-A-110.](#)
- [A.17 System control signals on page Appx-A-111.](#)
- [A.18 System status signals on page Appx-A-112.](#)
- [A.19 DFT interface signals on page Appx-A-113.](#)

A.1 Clock signals

The SSE-123 Example Subsystem uses a single set of standard clock signals.

The following table shows the clock signals.

Table A-1 Clock signals

Name	Direction	Power domain	Reset domain	Description
FCLK	Input	PD_AON	nPORESET	Free-running clock. This clock generates all clocks within the subsystem.
SCLK	Output	PD_AON	nSYSRESET	System domain clock. Gated when PD_SYS is powered OFF.
HCLK	Output	PD_SYS	nHRESET	Main bus clock. Dynamically clock gated.
DCLK	Output	PD_SYS	nDBGRESET	Debug clock. Dynamically clock gated.

A.2 Reset signals

The SSE-123 Example Subsystem uses a single set of standard reset signals.

The following table shows the reset signals.

Table A-2 Reset signals

Name	Direction	Power domain	Clock domain	Description
nPORESET	Input	PD_AON	FCLK	Active-LOW subsystem reset.
nSRST	Input	PD_AON	Async	Active-LOW debug system reset.
nAONRESET	Output	PD_AON	FCLK	Active-LOW always on domain reset.
nAONRESET_ASYNC	Output	PD_AON	Async	Active-LOW always on domain reset, not synchronized to FCLK .
nWARMAONRESET	Output	PD_AON	FCLK	Active-LOW warm always on domain reset.
nSYSPDRESET	Output	PD_AON	Async	Active-LOW system power domain reset.
nSYSRESET	Output	PD_SYS	SCLK	Active-LOW SCLK synchronized reset.
nWARMSYSRESET	Output	PD_SYS	SCLK	Active-LOW warm system power domain reset.
nHRESET	Output	PD_SYS	HCLK	Active-LOW HCLK synchronized reset.
nHRESET_ASYNC	Output	PD_SYS	Async	Active-LOW HCLK synchronized reset, not synchronized to FCLK .
nCOREHRESET	Output	PD_SYS	HCLK	Active-LOW HCLK synchronized reset for processor core, that nSRST can hold.
nDBGRESET	Output	PD_SYS	DCLK	Active-LOW DCLK synchronized reset.

A.3 Clock control interface signals

The SSE-123 Example Subsystem contains a clock control interface.

Power domain

PD_AON

Reset domain

nAONRESET

Clock domain

FCLK

The following table shows the clock control interface signals.

Table A-3 Clock control interface signals

Signal	Direction	Description
FCLKSTATEREQn	Output	Active-LOW request for high frequency clock to be supplied for FCLK .

A.4 HCLK clock Q-Channel signals

The SSE-123 Example Subsystem contains **HCLK** clock Q-Channel signals.

Power domain
PD_SYS

Reset domain
nWARMSYSRESET, nHRESET

Clock domain
SCLK, HCLK

The following table shows the **HCLK** clock Q-Channel signals.

Table A-4 HCLK clock Q-Channel signals

Signal	Direction	Description
HCLK_QREQn	Output	HCLK Q-Channel request from clock controller.
HCLK_QACCEPTn	Input	HCLK Q-Channel accept response to clock controller.
HCLK_QDENY	Input	HCLK Q-Channel deny response to clock controller.
HCLK_QACTIVE	Input	HCLK Q-Channel device activity indication to clock controller.

A.5 DCLK clock Q-Channel signals

The SSE-123 Example Subsystem contains **DCLK** clock Q-Channel signals.

Power domain
PD_SYS

Reset domain
nSYSRESET, nDBGRESET

Clock domain
SCLK, DCLK

The following table shows the **DCLK** clock Q-Channel signals.

Table A-5 DCLK clock Q-Channel signals

Signal	Direction	Description
DCLK_QREQn	Output	DCLK Q-Channel request from clock controller.
DCLK_QACCEPTn	Input	DCLK Q-Channel accept response to clock controller.
DCLK_QDENY	Input	DCLK Q-Channel deny response to clock controller.
DCLK_QACTIVE	Input	DCLK Q-Channel device activity indication to clock controller.

A.6 Entry delay signals

The SSE-123 Example Subsystem contains entry delay signals.

Power domain

PD_AON

Reset domain

nAONRESET

Clock domain

FCLK

The following table shows the entry delay signals.

Table A-6 Entry delay signals

Signal	Direction	Description
HCLK_ENTRYDELAY[7:0]	Input	Defines the number of delay cycles before the HCLK hierarchical clock gated domains enter the quiescence sequence.
DCLK_ENTRYDELAY[7:0]	Input	Defines the number of delay cycles before the DCLK hierarchical clock gated domains enter the quiescence sequence.

A.7 Clock enable signals

The SSE-123 Example Subsystem contains clock enable signals.

Power domain

PD_AON

Reset domain

nAONRESET

Clock domain

FCLK

The following table shows the clock enable signals.

Table A-7 Clock enable signals

Signal	Direction	Description
SYSPPUDEVCLKEN	Output	Device clock enable from SYS PPU.

A.8 Reset control interface signals

The SSE-123 Example Subsystem contains reset control interfaces.

Reset domain

Async

Clock domain

Async

The following table shows the reset control interface signals.

Table A-8 Reset control interface signals

Signal	Direction	Power domain	Description
HWRESETREQ	Input	PD_AON	Reset request for system power domain.
HRESETDEVREQ	Output	PD_SYS	Device reset request for nHRESET .
HRESETDEVACK	Input	PD_SYS	Device reset request acknowledge for nHRESET .

A.9 Power control interfaces

The SSE-123 Example Subsystem contains the power control interfaces that this section describes.

This section contains the following subsections:

- [A.9.1 PD_SYS power Q-Channel signals on page Appx-A-93.](#)
- [A.9.2 Debug power interface signals on page Appx-A-93.](#)
- [A.9.3 PPU power mode status signal on page Appx-A-93.](#)

A.9.1 PD_SYS power Q-Channel signals

The SSE-123 Example Subsystem contains **PD_SYS** power Q-Channel signals.

Power domain

PD_AON

Reset domain

nWARMAONRESET, nWARMSYSRESET, or nHRESET

Clock domain

FCLK, SCLK, or HCLK

The following table shows the **PD_SYS** power Q-Channel signals.

Table A-9 PD_SYS power Q-Channel signals

Signal	Direction	Description
PDSYSQREQn	Output	PD_SYS Q-Channel request from SYS PPU.
PDSYSQACCEPTn	Input	PD_SYS Q-Channel accept response to SYS PPU.
PDSYSQDENY	Input	PD_SYS Q-Channel deny response to SYS PPU.
PDSYSQACTIVE	Input	PD_SYS Q-Channel device activity indication to SYS PPU.

A.9.2 Debug power interface signals

The SSE-123 Example Subsystem contains debug power interface signals.

Power domain

PD_AON

Reset domain

nAONRESET

Clock domain

Async

The following table shows the debug power interface signals.

Table A-10 Debug power interface signals

Signal	Direction	Description
DAPPWRUPREQ	Input	Active-HIGH powerup request from debugger to subsystem power control.
DAPPWRUPACK	Output	Active-HIGH powerup acknowledge signal that indicates to the debugger that the subsystem is powered- up.

A.9.3 PPU power mode status signal

The SSE-123 Example Subsystem contains a PPU power mode status signal.

The following table shows the PPU power mode status signal.

Table A-11 PPU power mode status signal

Signal	Direction	Description
SYSPPUHWSTAT[15:0]	Output	SYS PPU current power mode.

A.10 Expansion interfaces

The SSE-123 Example Subsystem contains the expansion interfaces that this section describes.

This section contains the following subsections:

- [A.10.1 AHB5 expansion master interface 0 on page Appx-A-95.](#)
- [A.10.2 AHB5 expansion master interface 1 on page Appx-A-96.](#)
- [A.10.3 AHB5 expansion slave interface on page Appx-A-97.](#)
- [A.10.4 Single cycle I/O interface signals on page Appx-A-98.](#)

A.10.1 AHB5 expansion master interface 0

The SSE-123 Example Subsystem contains an AHB5 expansion master interface 0.

Power domain
PD_SYS

Reset domain
nHRESET

Clock domain
HCLK

The following table shows the AHB5 expansion master interface 0 properties.

Table A-12 AHB5 expansion master interface 0 properties

Interface properties	Value	Comment
Extended_Memory_Types	TRUE	Pass-through. Not used by the subsystem.
Secure_Transfers	TRUE	Supported.
Endian	N/A	Pass-through. The bus matrix provides no built-in endian adaptation.
Stable_Between_Clock	FALSE	Not supported for the CoreLink SIE-200 System IP for Embedded.
Exclusive_Transfers	TRUE	Pass-through. Not used by the subsystem.
Multi_Copy_Atomicity	TRUE	No caches or buffering that make a transfer visible to only some agents.

The following table shows the AHB5 expansion master interface 0 signals.

Table A-13 AHB5 expansion master interface 0 signals

Signal	Direction	Description
HSEL_EXPM0	Output	Slave select.
HADDR_EXPM0[31:0]		Address.
HTRANS_EXPM0[1:0]		Transfer type.
HWRITE_EXPM0		Transfer direction indicator.
HSIZE_EXPM0[2:0]	Output	Transfer size.
HBURST_EXPM0[2:0]		Burst type.
HPROT_EXPM0[6:0]		Protection control.
HMASTER_EXPM0[4:0]		Master identifier.

Table A-13 AHB5 expansion master interface 0 signals (continued)

Signal	Direction	Description
HWDATA_EXPM0[31:0]	Output	Write data.
HMASTLOCK_EXPM0		Locked sequence indicator.
HREADY_EXPM0		Transfer completion indicator from external interconnect.
HNONSEC_EXPM0		Non-secure transfer indicator.
HEXCL_EXPM0	Output	Exclusive transfer indicator.
HAUSER_EXPM0[1:0]		Address channel User signals.
HWUSER_EXPM0[1:0]		Write channel User signals.
HRDATA_EXPM0[31:0]	Input	Read data.
HREADYOUT_EXPM0		Transfer completion indicator to external interconnect or master.
HRESP_EXPM0		Transfer response.
HEXOKAY_EXPM0		Exclusive okay.
HRUSER_EXPM0[1:0]		Read channel User signals.

A.10.2 AHB5 expansion master interface 1

The SSE-123 Example Subsystem contains an AHB5 expansion master interface 1.

Power domain
PD_SYS

Reset domain
nHRESET

Clock domain
HCLK

The following table shows the AHB5 expansion master interface 1 properties.

Table A-14 AHB5 expansion master interface 1 properties

Interface properties	Value	Comment
Extended_Memory_Types	TRUE	Pass-through. Not used by the subsystem.
Secure_Transfers	TRUE	Supported.
Endian	N/A	Pass-through. The bus matrix provides no built-in endian adaptation.
Stable_Between_Clock	FALSE	Not supported for the CoreLink SIE-200 System IP for Embedded.
Exclusive_Transfers	TRUE	Pass-through. Not used by the subsystem.
Multi_Copy_Atomicity	TRUE	No caches or buffering that make a transfer visible to only some agents.

The following table shows the AHB5 expansion master interface 1 signals.

Table A-15 AHB5 expansion master interface 1 signals

Signal	Direction	Description
HSEL_EXPM1	Output	Slave select.
HADDR_EXPM1[31:0]		Address.
HTRANS_EXPM1[1:0]		Transfer type.
HWRITE_EXPM1		Transfer direction indicator.
HSIZE_EXPM1[2:0]	Output	Transfer size.
HBURST_EXPM1[2:0]		Burst type.
HPROT_EXPM1[6:0]		Protection control.
HMASTER_EXPM1[4:0]		Master identifier.
HWDATA_EXPM1[31:0]	Output	Write data.
HMASTLOCK_EXPM1		Locked sequence indicator.
HREADY_EXPM1		Transfer completion indicator from external interconnect.
HNONSEC_EXPM1		Non-secure transfer indicator.
HEXCL_EXPM1	Output	Exclusive transfer indicator.
HAUSER_EXPM1[1:0]		Address channel User signals.
HWUSER_EXPM1[1:0]		Write channel User signals.
HRDATA_EXPM1[31:0]	Input	Read data.
HREADYOUT_EXPM1		Transfer completion indicator to external interconnect or master.
HRESP_EXPM1		Transfer response.
HEXOKAY_EXPM1		Exclusive okay.
HRUSER_EXPM1[1:0]		Read channel User signals.

A.10.3 AHB5 expansion slave interface

The SSE-123 Example Subsystem contains an AHB5 expansion slave interface.

Power domain
PD_SYS

Reset domain
nHRESET

Clock domain
HCLK

The following table shows the AHB5 expansion slave interface properties.

Table A-16 AHB5 expansion slave interface properties

Interface properties	Value	Comment
Extended_Memory_Types	TRUE	Pass-through. Not used by the subsystem.
Secure_Transfers	TRUE	Supported.
Endian	N/A	Pass-through. The bus matrix provides no built-in endian adaptation.
Stable_Between_Clock	FALSE	Not supported for the CoreLink SIE-200 System IP for Embedded.

Table A-16 AHB5 expansion slave interface properties (continued)

Interface properties	Value	Comment
Exclusive_Transfers	TRUE	Pass-through. Not used by the subsystem.
Multi_Copy_Atomicity	TRUE	No caches or buffering that make a transfer visible to only some agents.

The following table shows the AHB5 expansion slave interface signals.

Table A-17 AHB5 expansion slave interface signals

Signal	Direction	Description
HSEL_EXPS0	Input	Slave select.
HADDR_EXPS0[31:0]		Address.
HTRANS_EXPS0[1:0]		Transfer type.
HWRITE_EXPS0		Transfer direction indicator.
HSIZE_EXPS0[2:0]	Input	Transfer size.
HBURST_EXPS0[2:0]		Burst type.
HPROT_EXPS0[6:0]		Protection control.
HMASTER_EXPS0[3:0]		Master identifier.
HWDATA_EXPS0[31:0]	Input	Write data.
HMASTLOCK_EXPS0		Locked sequence indicator.
HREADY_EXPS0		Transfer completion indicator from external interconnect.
HNONSEC_EXPS0		Non-secure transfer indicator.
HEXCL_EXPS0	Input	Exclusive transfer indicator.
HAUSER_EXPS0[1:0]		Address channel User signals.
HWUSER_EXPS0[1:0]		Write channel User signals.
HRDATA_EXPS0[31:0]	Output	Read data.
HREADYOUT_EXPS0		Transfer completion indicator to external interconnect or master.
HRESP_EXPS0		Transfer response.
HEXOKAY_EXPS0		Exclusive okay.
HRUSER_EXPS0[1:0]		Read channel User signals.

A.10.4 Single cycle I/O interface signals

The SSE-123 Example Subsystem contains a single cycle I/O interface.

Power domain
PD_SYS

Reset domain
nHRESET

Clock domain
HCLK

The following table shows the single cycle I/O interface signals.

Table A-18 Single cycle I/O interface signals

Signal	Direction	Description
IOTRANS	Output	I/O port transaction valid.
IOADDR[31:0]	Output	I/O port transaction address.
IOWRITE	Output	I/O port transaction write control: LOW Transaction is a read. HIGH Transaction is a write.
IOWDATA[31:0]	Output	I/O port write data, for writes.
IOSIZE[1:0]	Output	I/O port transaction size: 0b00 Byte, 8-bit. 0b01 Halfword, 16-bit. 0b10 Word, 32-bit. 0b11 Never used.
IOPRIV	Output	I/O port transaction privilege level: LOW Non-privileged. HIGH Privileged.
IOMASTER	Output	I/O port transaction source: LOW Transaction from software on processor. HIGH Transaction through debug interface.
IORDATA[31:0]	Input	I/O port read data, for reads.
IONONSEC	Output	I/O port transaction security: LOW Transaction is Secure. HIGH Transaction is Non-secure.

A.11 Interrupt signals

The SSE-123 Example Subsystem contains interrupt signals.

Power domain

PD_AON

Reset domain

nAONRESET

Clock domain

FCLK

The following table shows the interrupt signals.

Table A-19 Interrupt signals

Signal	Direction	Description
EXPIRQ[NUM_EXPIRQ-1:0]	Input	Expansion interrupt inputs from devices that are connected to the subsystem.
EXPNMI	Input	Expansion Non-maskable interrupt from a device that is connected to the subsystem.

A.12 Timestamp signals

The SSE-123 Example Subsystem contains timestamp signals.

The following table shows the timestamp signals.

Table A-20 Timestamp signals

Signal	Direction	Power domain	Reset domain	Clock domain	Description
TSVALUEB_SYS[63:0]	Input	PD_AON	nAONRESET	FCLK	System timestamp value in binary encoding.
TSVALUEB_DBG[47:0]	Input	PD_SYS	nDBGRESET	DCLK	Debug timestamp value in binary encoding.
TSCLKCHANGE_DBG	Input	PD_SYS	nDBGRESET	DCLK	<p>Debug timestamp clock change.</p> <p>The clock change signal is pulsed HIGH, for one FCLK cycle when either the FCLK frequency or the timestamp counter clock frequency changes.</p> <p>The TSCLKCHANGE signal informs the trace tools that any previously inferred frequency relationships might have changed, and must therefore be recalculated for future reference.</p> <p style="text-align: center;">————— Note —————</p> <p>Because this process takes some time, it does not matter if the pulse timing varies by a few cycles from the actual change of clock frequency.</p> <p>—————</p>

A.13 Event signals

The SSE-123 Example Subsystem contains event signals.

Reset domain

nAONRESET

Clock domain

FCLK

The following table shows the event signals.

Table A-21 Event signals

Signal	Direction	Power domain	Description
RXEV	Input	PD_AON	A HIGH on this input causes the Arm v8-M architecture-defined Event Register to be set in the Cortex-M23 processor and a WFE instruction to complete. It also wakes the processor if it is sleeping as the result of encountering a WFE instruction when the Event Register is clear.
TXEV	Output	PD_SYS	A single FCLK cycle pulse is generated on this output every time an SEV instruction is executed on the Cortex-M23 processor.

A.14 Debug interfaces

The SSE-123 Example Subsystem contains the debug interfaces that this section describes.

This section contains the following subsections:

- [A.14.1 Debug authentication signals](#) on page Appx-A-103.
- [A.14.2 Debug slave interface signals](#) on page Appx-A-104.
- [A.14.3 ATB ETM slave interface signals](#) on page Appx-A-104.
- [A.14.4 ETM control signals](#) on page Appx-A-105.
- [A.14.5 Cross Trigger Interface signals](#) on page Appx-A-105.
- [A.14.6 APB debug expansion master interface signals](#) on page Appx-A-105.

A.14.1 Debug authentication signals

The SSE-123 Example Subsystem contains debug authentication signals.

Power domain

PD_AON

Reset domain

nAONRESET

Clock domain

FCLK

The following table shows the debug authentication signals.

Table A-22 Debug authentication signals

Signal	Direction	Description
DBGENIN	Input	Invasive debug enable input.
NIDENIN	Input	Non-invasive debug enable input.
SPIDENIN	Input	Secure invasive debug enable input.
SPNIDENIN	Input	Secure non-invasive debug enable input.
DBGEN	Output	Invasive debug enable output.
NIDEN	Output	Non-invasive debug enable output.
SPIDEN	Output	Secure invasive debug enable output.
SPNIDEN	Output	Secure non-invasive debug enable output.
DBGEN_SEL_DIS	Input	DBGEN selector disable. When set HIGH, disables the DBGEN selector logic and forces DBGEN to use DBGENIN .
NIDEN_SEL_DIS	Input	NIDEN selector disable. When set HIGH, disables the NIDEN selector logic and forces NIDEN to use NIDENIN .
SPIDEN_SEL_DIS	Input	SPIDEN selector disable. When set HIGH, disables the SPIDEN selector logic and forces SPIDEN to use SPIDENIN .
SPNIDEN_SEL_DIS	Input	SPNIDEN selector disable. When set HIGH, disables the SPNIDEN selector logic and forces SPNIDEN to use SPNIDENIN .

A.14.2 Debug slave interface signals

The SSE-123 Example Subsystem contains debug slave interface signals.

Power domain
PD_SYS

Reset domain
nDBGRESET

Clock domain
DCLK

The following table shows the debug slave interface signals.

Table A-23 Debug slave interface signals

Signal	Direction	Description
HRDATA_SDBG[31:0]	Output	Read data.
HREADY_SDBG	Output	Transfer completion indicator.
HRESP_SDBG	Output	Transfer response.
HADDR_SDBG[31:0]	Input	Address.
HTRANS_SDBG[1:0]	Input	Transfer type.
HWRITE_SDBG	Input	Transfer direction indicator.
HWDATA_SDBG[31:0]	Input	Write data.
HSIZE_SDBG[1:0]	Input	Size of the transfer.
HPROT_SDBG[6:0]	Input	Protection control.
HNONSEC_SDBG	Input	Non-secure transfer indicator.

A.14.3 ATB ETM slave interface signals

The SSE-123 Example Subsystem contains ATB ETM slave interface signals.

Power domain
PD_SYS

Reset domain
nDBGRESET

Clock domain
DCLK

The following table shows the ATB ETM slave interface signals.

Table A-24 ATB ETM slave interface signals

Signal	Direction	Description
ATREADY_ETM	Input	ETM is ready to accept data.
ATDATA_ETM[7:0]	Output	Trace data.
ATVALID_ETM	Output	A transfer is valid during this cycle. If LOW, all other AT signals must be ignored during this cycle.
AFREADY_ETM	Output	ETM FIFO has been flushed.

Table A-24 ATB ETM slave interface signals (continued)

Signal	Direction	Description
ATID_ETM[6:0]	Output	Identifies the source of the trace.
AFVALID_ETM	Input	ETM FIFO flush request.

A.14.4 ETM control signals

The SSE-123 Example Subsystem contains *Embedded Trace Macrocell* (ETM) control signals.

The following table shows the ETM control signals.

Table A-25 ETM control signals

Signal	Direction	Description
ETMFIFOFULLEN	Input	Indicates support for FIFOFULL functionality by reading an ETM register.
ETMEN	Output	Set by the trace software tools to ensure that the trace output is enabled from the ETM.
ETMTRIGOUT	Output	Indicates a trigger packet in the trace stream.

A.14.5 Cross Trigger Interface signals

The SSE-123 Example Subsystem contains *Cross Trigger Interface* (CTI) signals.

Power domain
PD_SYS

Reset domain
nDBGRESET

Clock domain
DCLK

The following table shows the CTI signals.

Table A-26 CTI signals

Signal	Direction	Description
CTICHIN[3:0]	Input	CTI channel in.
CTICHOUT[3:0]	Output	CTI channel out.

A.14.6 APB debug expansion master interface signals

The SSE-123 Example Subsystem contains APB debug expansion master interface signals.

Power domain
PD_SYS

Reset domain
nDBGRESET

Clock domain
DCLK

The following table shows the APB debug expansion master interface signals.

Table A-27 APB debug expansion master interface signals

Signal	Direction	Description
PADDR_MDBG[31:0]	Output	Address.
PSEL_MDBG	Output	Peripheral select.
PENABLE_MDBG	Output	Enable for transfer.
PWRITE_MDBG	Output	Write transaction indicator.
PWDATA_MDBG[31:0]	Output	Write data.
PREADY_MDBG	Input	Transfer ready.
PRDATA_MDBG[31:0]	Output	Read data.
PSLVERR_MDBG	Input	Error response.

A.15 Security control expansion signals

The SSE-123 Example Subsystem contains security control expansion signals.

Power domain
PD_SYS

Reset domain
nHRESET

Clock domain
HCLK

The following table shows the security control expansion signals.

Table A-28 Security control expansion signals

Signal	Direction	Description
ACCWAITN	Output	<p>This request signal controls any external gating unit that might be required to block accesses to the system using the AHB slave expansion interfaces:</p> <p>0 No gating. 1 Access gated.</p> <p>The <i>BUSWAIT, Bus Access Wait register on page 3-62</i> controls this signal.</p>
ACCWAITN_STAT	Input	<p>This status signal indicates the current state of any external gating unit that might be used to block access to the system using the AHB slave expansion interfaces:</p> <p>0 No gating. 1 Access gated.</p> <p>The <i>BUSWAIT, Bus Access Wait register on page 3-62</i> can read this signal.</p>
SECRESPCFG	Output	<p>This signal configures how to respond to an access when a security violation occurs.</p> <p>0 Read-Zero Write Ignore. 1 Bus error.</p> <p>The <i>SECRESPCFG, Security Violation Response Configuration register on page 3-63</i> controls this signal.</p>
SMPCEXP_STAT[15:0]	Input	<p>Interrupt status inputs from all expansion memory protection controller. These inputs are visible to the programmer using the <i>SECMPCCINTSTATUS, Secure MPC Interrupt Status register on page 3-64</i> and raise an interrupt using the MPC combined interrupt.</p> <p>The MPCEXP_DIS top-level parameter enables each individual bit of the interface to be disabled. See the <i>Arm® SSE-123 Example Subsystem Configuration and Integration Manual</i>.</p>
APBPPCEXP_STAT[3:0]	Input	<p>APB PPC interrupt status input. Each bit is to be connected to a single APB PPC. These bits are associated with the S_APBPPCEXP_STATUS field in the <i>SECPPCCINTSTAT, Secure PPC Interrupt Status register on page 3-65</i>, <i>SECPPCCINTCLR, Secure PPC Interrupt Clear register on page 3-66</i>, and <i>SECPPCCINTEN, Secure PPC Interrupt Enable register on page 3-67</i>.</p>

Table A-28 Security control expansion signals (continued)

Signal	Direction	Description
APBPPCEXP_CLR[3:0]	Output	APB PPC interrupt clear output. Each bit is to be connected to a single APB PPC. These bits are associated with the S_APBPPCEXP_CLR field in the <i>SECPPCINTSTAT</i> , <i>Secure PPC Interrupt Status register on page 3-65</i> , <i>SECPPCINTCLR</i> , <i>Secure PPC Interrupt Clear register on page 3-66</i> , and <i>SECPPCINTEN</i> , <i>Secure PPC Interrupt Enable register on page 3-67</i> .
APBNSPPCEXP0[15:0]	Output	APB PPC Non-secure gating control. Each bit is to be connected to a PPC to control Non-secure access for an APB interface. The <i>APBNSPPCEXP0</i> , <i>APBNSPPCEXP1</i> , <i>APBNSPPCEXP2</i> , and <i>APBNSPPCEXP3</i> , <i>APB Non-Secure Access PPC Expansion registers on page 3-74</i> drive these signals. The APBPPCEXP_DIS<X> top-level parameter enables individual bits to be disabled. See the <i>Arm® SSE-123 Example Subsystem Configuration and Integration Manual</i> .
APBNSPPCEXP1[15:0]		
APBNSPPCEXP2[15:0]		
APBNSPPCEXP3[15:0]		
APBPPCEXP0[15:0]	Output	APB PPC Privilege Gating Control. Each bit is to be connected to a PPC to control privilege access for an APB interface. The values of APBNSPPCEXP<X> or APBSPPPCEXP<X> drive these signals. Selection of the source register for these signals depends on the bits set in the <i>APBNSPPCEXP0</i> , <i>APBNSPPCEXP1</i> , <i>APBNSPPCEXP2</i> , and <i>APBNSPPCEXP3</i> , <i>APB Non-Secure Access PPC Expansion registers on page 3-74</i> . The APBPPCEXP_DIS<X> top-level parameter enables individual bits to be disabled. See the <i>Arm® SSE-123 Example Subsystem Configuration and Integration Manual</i> .
APBPPCEXP1[15:0]		
APBPPCEXP2[15:0]		
APBPPCEXP3[15:0]		
SAHBPPCEXP_STAT[3:0]	Input	AHB PPC interrupt status input. Each bit is to be connected to a single AHB PPC. These bits are associated with the S_AHBPPCEXP_STATUS field in the <i>SECPPCINTSTAT</i> , <i>Secure PPC Interrupt Status register on page 3-65</i> , <i>SECPPCINTCLR</i> , <i>Secure PPC Interrupt Clear register on page 3-66</i> , and <i>SECPPCINTEN</i> , <i>Secure PPC Interrupt Enable register on page 3-67</i> .
SAHBPPCEXP_CLR[3:0]	Output	AHB PPC interrupt clear output. Each bit is to be connected to a single AHB PPC. These bits are associated with the S_AHBPPCEXP_CLR field in the <i>SECPPCINTSTAT</i> , <i>Secure PPC Interrupt Status register on page 3-65</i> , <i>SECPPCINTCLR</i> , <i>Secure PPC Interrupt Clear register on page 3-66</i> , and <i>SECPPCINTEN</i> , <i>Secure PPC Interrupt Enable register on page 3-67</i> .
AHBNSPPCEXP[15:0]	Output	AHB PPC Non-secure gating control. Each bit is to be connected to a PPC to control Non-secure access for an AHB interface. The <i>AHBNSPPCEXP</i> , <i>AHB Non-Secure Access PPC Expansion register on page 3-73</i> drives these signals. The AHBPPCEXP_DIS top-level parameter enables individual bits to be disabled. See the <i>Arm® SSE-123 Example Subsystem Configuration and Integration Manual</i> .
AHBPPCEXP[15:0]	Output	APB PPC privilege gating control. Each bit is to be connected to a PPC to control privilege access for an APB interface. The <i>AHBSPPPCEXP</i> , <i>AHB Secure Privilege Access PPC Expansion register on page 3-75</i> drives these signals. The AHBPPCEXP_DIS top-level parameter enables individual bits to be disabled. See the <i>Arm® SSE-123 Example Subsystem Configuration and Integration Manual</i> .

Table A-28 Security control expansion signals (continued)

Signal	Direction	Description
SMSCEXP_STAT[15:0]	Input	<p>MSC interrupt status input.</p> <p>Each bit is to be connected to a single MSC. These bits are associated with the S_MSCEXP_STATUS field in the <i>SECMSINTSTAT, Secure MSC Interrupt Status register on page 3-68</i>, <i>SECMSINTCLR, Secure MSC Interrupt Clear register on page 3-69</i>, and <i>SECMSINTEN, Secure MSC Interrupt Enable register on page 3-70</i>.</p> <p>The MSCEXP_DIS top-level parameter enables each individual bit of the interface to be disabled. See the <i>Arm® SSE-I23 Example Subsystem Configuration and Integration Manual</i>.</p>
SMSCEXP_CLR[15:0]	Output	<p>MSC interrupt clear output. Each bit is to be connected to a single MSC. These bits are associated with the S_MSCEXP_CLR field in the <i>SECMSINTSTAT, Secure MSC Interrupt Status register on page 3-68</i>, <i>SECMSINTCLR, Secure MSC Interrupt Clear register on page 3-69</i>, and <i>SECMSINTEN, Secure MSC Interrupt Enable register on page 3-70</i>.</p> <p>The MSCEXP_DIS top-level parameter enables each individual bit of the interface to be disabled. See the <i>Arm® SSE-I23 Example Subsystem Configuration and Integration Manual</i>.</p>
NSMSCEXP[15:0]	Output	<p>MSC Non-secure configuration.</p> <p>Each bit is to be connected to a single MSC. The NS_MSCEXP field in the <i>NSMSCEXP, Non-Secure Access MSC Expansion register on page 3-77</i> drives these signals.</p> <p>The MSCEXP_DIS top-level parameter enables each individual bit of the interface to be disabled. See the <i>Arm® SSE-I23 Example Subsystem Configuration and Integration Manual</i>.</p>
BRGEXP_STAT[15:0]	Input	<p>Bridge error interrupt status input. Each bit is to be connected to a single bridge. These bits are associated with the BRGEXP_STATUS field in the <i>BRGINTSTAT, Bridge Interrupt Status register on page 3-70</i>, <i>BRGINTCLR, Bridge Interrupt Clear register on page 3-71</i>, and <i>BRGINTEN, Bridge Interrupt Enable register on page 3-72</i>.</p> <p>The BRGEXP_DIS top-level parameter enables each individual bit of the interface to be disabled. See the <i>Arm® SSE-I23 Example Subsystem Configuration and Integration Manual</i>.</p>
BRGEXP_CLR[15:0]	Output	<p>Bridge error interrupt clear output. Each bit is to be connected to a single bridge. These bits are associated with the BRGEXP_CLEAR field in the <i>BRGINTSTAT, Bridge Interrupt Status register on page 3-70</i>, <i>BRGINTCLR, Bridge Interrupt Clear register on page 3-71</i>, and <i>BRGINTEN, Bridge Interrupt Enable register on page 3-72</i>.</p> <p>The BRGEXP_DIS top-level parameter enables each individual bit of the interface to be disabled. See the <i>Arm® SSE-I23 Example Subsystem Configuration and Integration Manual</i>.</p>

A.16 Static configuration signals

The SSE-123 Example Subsystem contains static configuration signals.

The following table shows the static configuration signals.

Table A-29 Static configuration signals

Signal	Direction	Description
INITVTOR_RST[23:0]	Input	Default Secure vector table offset at reset. Sets the reset value for the <i>INITVTOR</i> , <i>Initial Secure Vector Table Offset register</i> on page 3-56.
CPUWAIT_RST	Input	Default CPUWAIT value at reset. Sets the reset value of the <i>CPUWAIT</i> , <i>CPU Wait register</i> on page 3-57.

A.17 System control signals

The SSE-123 Example Subsystem contains system control signals.

Power domain

PD_AON

Reset domain

nPORESET

Clock domain

Async

The following table shows the system control signals.

Table A-30 System control signals

Signal	Direction	Description
CPUWAIT_CLR	Input	<p>The HIGH level of CPUWAIT_CLR detected by the subsystem clears the <i>CPUWAIT</i>, <i>CPU Wait register on page 3-57</i> once, enabling the processor to boot.</p> <p>This input can be asynchronous to the subsystem. If it is asynchronous, it can be used with the CPUWAIT_CLR_R output as a 4-phase handshake to ensure capture across domains.</p>
CPUWAIT_CLR_R	Output	The status of CPUWAIT_CLR after synchronization to the subsystem.

A.18 System status signals

The SSE-123 Example Subsystem contains system status signals.

The following table shows the system status signals.

Table A-31 System status signals

Signal	Direction	Description
WICSENSE[241:0]	Output	Active-HIGH set of signals. These signals indicate which input lines can cause the <i>Wakeup Interrupt Controller</i> (WIC) to wakeup the subsystem.
HALTED	Output	Indicates that the processor is halted.

A.19 DFT interface signals

The SSE-123 Example Subsystem contains DFT interface signals.

The following table shows the DFT interface signals.

Table A-32 DFT interface signals

Signal	Direction	Description
DFTCGEN	Input	DFT clock gate enable.
DFTISODISABLE	Input	DFT isolation disable. Use DFTISODISABLE to disable isolation of all the internal power domains.
DFTPWRUP	Input	DFT powerup. Use DFTPWRUP to force all the internal power domains to turn on.
DFTRSTDISABLE	Input	DFT reset disable.
DFTRAMHOLD	Input	DFT RAM hold.

Appendix B

System time components

This appendix describes the SSE-123 Example Subsystem system time components.

It contains the following sections:

- *B.1 About system time components* on page Appx-B-115.
- *B.2 System Counter* on page Appx-B-116.
- *B.3 System Timer* on page Appx-B-123.
- *B.4 System Watchdog* on page Appx-B-130.

B.1 About system time components

Three system time components are delivered with the SSE-123 Example Subsystem product and integrated as an example in the SSE-123 Subsystem and SSE-123 Integration.

The system time components are as follows:

- The System Counter generates a timestamp value that can be shared across the *System on Chip* (SoC).
- The System Timer can raise an interrupt when a period has elapsed.
- System Watchdog provides a mechanism to detect errant system behavior causing reset of the system if a period elapses without intervention.

The components are software-programmable using APB interfaces. This section defines the programmers model of the components.

The following figure shows an example SoC that uses the system time components.

Figure B-1 Example SoC that uses the system time components

B.2 System Counter

The SSE-123 Example Subsystem contains a system counter.

This section contains the following subsections:

- [B.2.1 System Counter overview on page Appx-B-116.](#)
- [B.2.2 Counter operation on page Appx-B-116.](#)
- [B.2.3 Programmers model on page Appx-B-117.](#)

B.2.1 System Counter overview

This section provides an overview of the System Counter.

The System Counter has the following features:

- Binary encoded, unsigned, 64-bit up-counter, starts counting from 0, with the optional ability to start counting from a different preload value.
- Generates a 64-bit time value that compatible components across the SoC can share.
- Internal 24-bit fractional value to allow fine count resolution control.
- Ability to scale counter clock frequency, therefore allowing operation at lower frequency during low-power mode.
- Hardware can handle dynamic clock switching between different frequencies. Software is required only for initialization.
- Support of software enabled halt-on-debug from external CoreSight *Cross Trigger Interface* (CTI).

The following figure shows a block diagram of the System Counter that is integrated within the SSE-123 Integration.

Figure B-2 System Counter integrated within the SSE-123 Integration

For more information, see the *Arm® SSE-123 Example Subsystem Configuration and Integration Manual*.

B.2.2 Counter operation

This section describes pseudo-sequences for some of the commonly used Counter programming flows.

Counter initialization

To initialize the counter, perform the following steps:

1. Ensure that **CLKSEL** is 0x01 and that **REFCLK** is running.
2. Disable the counter by setting CNTCR.EN = 0.
3. Configure the SoC clock generation to generate the frequencies that are required for the two clock sources
4. Write to CNTSCR0 to set the scaling value for **REFCLK** clock source.
5. Write to CNTSCR1 to set the scaling value for **FASTCLK** clock source.
6. Enable the counter by setting CNTCR.EN = 1.
7. **CLKSEL** can now be changed at any time to switch the **FCLK** source between **REFCLK** and **FASTCLK**.

Changing scaling registers

To change the scaling registers, perform the following steps:

1. Ensure that **REFCLK** is running.
2. Disable the counter by setting CNTCR.EN = 0.
3. Write new values to CNTSCR0 and CNTSCR1.
4. Enable the counter by setting CNTCR.EN = 1.

B.2.3 Programmers model

This section describes programmers model for the System Counter.

Registers in the System Counter provide the following functions:

- Enabling and disabling the counter.
- Setting the counter value.
- Changing the operating mode, to change the frequency and increment value.
- Enabling Halt-on-debug, that a debugger can then use to suspend counting.
- Providing status of the Counter value in addition to the operating mode.

These registers are grouped into two 4KB frames:

- A control frame, CNTControlBase.
- A status frame, CNTReadBase.

The base addresses of these frames are IMPLEMENTATION DEFINED. Similarly, the security level of each frame is also IMPLEMENTATION DEFINED, however, in a system that supports both, secure and non-secure memory maps, CNTControlBase is only accessible by secure memory accesses.

See the SSE-123 Integration Programmers Model in the *Arm® SSE-123 Example Subsystem Configuration and Integration Manual* for the base addresses of these registers in the SSE-123 Integration.

CNTControlBase registers summary

This section provides a summary of the CNTControlBase Frame Registers (System Counter).

The following table shows a summary of the CNTControlBase Frame Registers (System Counter)

Table B-1 CNTControlBase Frame Registers (System Counter)

Offset	Name	Access	Reset value	Description
0x000	CNTCR	RW	0x0000_0000	Counter Control Register. See <i>CNTCR, Counter Control register</i> on page Appx-B-119.
0x004	CNTSR	RO	0x0000_000X	Counter Status Register. See <i>CNTSR, Counter Status register</i> on page Appx-B-120.
0x008	CNTCV[31:0]	RW	0xFFFF_FFFF	Counter Count Value register. See <i>CNTCV, Counter Count Value register</i> on page Appx-B-120.
0x00C	CNTCV[63:32]	RW	0xFFFF_FFFF	

Table B-1 CNTControlBase Frame Registers (System Counter) (continued)

Offset	Name	Access	Reset value	Description
0x010	CNTSCR ^b	RW	0x0100_0000	Counter Scale Register. See <i>CNTSCR</i> , <i>Counter Scale register</i> on page Appx-B-121.
0x014-0x018	-	RAZ/WI	-	Reserved.
0x01C	CNTID	RO	0x000X_000X	Counter ID register. See <i>CNTID</i> , <i>Counter ID register</i> on page Appx-B-121.
0x020-0x0BC	-	RAZ/WI	-	Reserved.
0x0C0-0x0CC	-	RAZ/WI	-	Reserved.
0x0D0	CNTSCR0 ^b	RW	0x0100_0000	Counter Scale Register 0. See <i>CNTSCR0</i> , <i>CNTSCR1</i> , <i>Counter Scaling registers</i> on page Appx-B-122.
0x0D4	CNTSCR1	RW	0x0100_0000	Counter Scale Register 1. See <i>CNTSCR0</i> , <i>CNTSCR1</i> , <i>Counter Scaling registers</i> on page Appx-B-122.
0x0D8-0xFCC	-	RAZ/WI	-	Reserved.
0xFD0	CNTPIDR4	RO	0x0000_0004	Peripheral Identification Register 4.
0xFD4-0xFDC	-	RAZ/WI	-	Reserved.
0xFE0	CNTPIDR0	RO	0x0000_00BA	Peripheral Identification Register 0.
0xFE4	CNTPIDR1	RO	0x0000_00B0	Peripheral Identification Register 1.
0xFE8	CNTPIDR2	RO	0x0000_000B	Peripheral Identification Register 2.
0xFEC	CNTPIDR3	RO	0x0000_0000	Peripheral Identification Register 3.
0xFF0	CNTCIDR0	RO	0x0000_000D	Component Identification Register 0.
0xFF4	CNTCIDR1	RO	0x0000_00F0	Component Identification Register 1.
0xFF8	CNTCIDR2	RO	0x0000_0005	Component Identification Register 2.
0xFFC	CNTCIDR3	RO	0x0000_00B1	Component Identification Register 3.

CNTReadBase registers summary

This section provides a summary of the CNTReadBase registers.

The following table shows a summary of the CNTReadBase Frame Registers (System Counter).

Table B-2 CNTReadBase Frame Registers (System Counter)

Offset	Name	Access	Reset value	Description
0x000	CNTCV[31:0]	RO	0xFFFF_FFFF	Counter Count Value register. See <i>CNTCV</i> , <i>Counter Count Value register</i> on page Appx-B-120.
0x004	CNTCV[63:32]	RO	0xFFFF_FFFF	
0x008-0xFCC	-	RAZ/WI	-	Reserved.
0xFD0	CNTPIDR4	RO	0x0000_0004	Peripheral Identification Register 4.
0xFD4-0xFDC	-	RAZ/WI	-	Reserved.
0xFE0	CNTPIDR0	RO	0x0000_00BB	Peripheral Identification Register 0.

^b CNTSCR is aliased with CNTSCR0, meaning that either addresses of CNTSCR and CNTSCR0 physically access a single register.

Table B-2 CNTReadBase Frame Registers (System Counter) (continued)

Offset	Name	Access	Reset value	Description
0xFE4	CNTPIDR1	RO	0x0000_00B0	Peripheral Identification Register 1.
0xFE8	CNTPIDR2	RO	0x0000_000B	Peripheral Identification Register 2.
0xFEC	CNTPIDR3	RO	0x0000_0000	Peripheral Identification Register 3.
0xFF0	CNTCIDR0	RO	0x0000_000D	Component Identification Register 0.
0xFF4	CNTCIDR1	RO	0x0000_00F0	Component Identification Register 1.
0xFF8	CNTCIDR2	RO	0x0000_0005	Component Identification Register 2.
0xFFC	CNTCIDR3	RO	0x0000_00B1	Component Identification Register 3.

Register descriptions

This section describes each System Counter register.

All registers are 32-bit and must be accessed using 32-bit reads and writes.

CNTCR, Counter Control register

The CNTCR register enables the counter, controls the counter frequency setting, and controls counter behavior during debug.

The following table shows the bit assignments.

Table B-3 CNTCR register bit assignments

Bits	Name	Access	Reset value	Function
[31:6]	-	RAZ/WI	0x0000	Reserved.
[5]	INTRCLR	RW	0x0	Interrupt clear bit, only writes of 0 are permitted, and writes of 1 are ignored. If APB logic is powered off when the interrupt output is asserted, this bit is cleared automatically. Therefore, it is the responsibility of software to ensure that there is no pending interrupt before powering off the APB logic.
[4]	PSLVERRDIS	RW	0x0	PSLVERR output disable: 0 PSLVERR permanently driven to '0'. 1 PSLVERR output that the System Counter generates dynamically.
[3]	INTRMASK	RW	0x0	Interrupt mask: 0 Interrupt output disabled. 1 Interrupt output enabled.

Table B-3 CNTCR register bit assignments (continued)

Bits	Name	Access	Reset value	Function
[2]	SCEN	RW	0x0	<p>Scale enable:</p> <p>0 Scaling is not enabled. The Counter value is incremented by 0x01.000000 for each counter tick.</p> <p>1 Scaling is enabled. The counter is incremented by the ScaleVal for each counter tick.</p> <p>The ScaleVal value that the System Counter uses is from CNTSCR, CNTSCR[0], or CNTSCR[1]. See CNTSCR0, CNTSCR1, Counter Scaling registers on page Appx-B-122.</p>
[1]	HDBG	RW	0x0	<p>Halt On Debug:</p> <p>0 HALTREQ signal into the Counter has no effect.</p> <p>1 HALTREQ signal into the Counter halts the Count.</p>
[0]	EN	RW	0x0	<p>Enable Counter:</p> <p>0 Disabled: Count is not incrementing.</p> <p>1 Enabled: Count is incrementing.</p>

CNTSR, Counter Status register

The CNTSR register provides Counter frequency status information.

The following table shows the bit assignments.

Table B-4 CNTSR register bit assignments

Bits	Name	Access	Reset value	Function
[31:2]	-	RAZ/WI.	0x000000	Reserved.
[1]	DBGH	RO	UNK	<p>Indicates whether the counter is halted because the Halt-on-Debug signal is asserted:</p> <p>0 Counter is not halted.</p> <p>1 Counter is halted.</p>
[0]	-	RAZ/WI.	0x0	Reserved.

CNTCV, Counter Count Value register

The CNTCV register indicates the current count value.

The following table shows the bit assignments.

Table B-5 CNTCV register bit assignments

Bits	Name	Access	Function
[63:0]	CountValue	RO from CNTReadBase. RW from CNTControlBase.	Indicates the count value.

CNTSCR, Counter Scale register

The CNTSCR registers store the Counter Scaling value.

The following table shows the bit assignments.

Table B-6 CNTSCR register bit assignments

Bits	Name	Access	Reset value	Function
[31:0]	ScaleVal	RW	0x0100_0000 ^c	<p>When counter scaling is enabled, ScaleVal is the amount added to the Counter Count Value for every period of the counter as determined by 1/Frequency from the current operating frequency of the system counter, the <i>counter tick</i>.</p> <p>ScaleVal is expressed as an unsigned fixed-point number with an 8-bit integer value and a 24-bit fractional value.</p> <p>The CNTSCR register can only be changed when the counter is disabled, that is, CNTCR.EN=0. If the value of CNTSCR changes when CNTCR.EN==1, then the Counter Count Value becomes UNKNOWN and remains UNKNOWN on future ticks of the clock.</p>

CNTID, Counter ID register

The CNTID register indicates additional information about Counter Scaling implementation.

The following table shows the bit assignments.

Table B-7 CNTID register bit assignments

Bits	Name	Access	Reset value	Function
[31:19]	-	RAZ/WI	0x0000	Reserved.
[19]	CNTSCR_OVR	RO	Defined by parameter with a default value of 0x0	<p>Override counter enable condition for writing to CNTSCR* registers:</p> <p>0 CNTSCR* can be written only when CNTCR.EN=0.</p> <p>1 CNTSCR* can be written when CNTCR.EN=0 or 1.</p>
[18:17]	CNTSELCLK	RO	0x01	<p>Indicates the clock source that the Counter is using. Based on the settings for Counter scaling, the Counter increment value is chosen either from one of the CNTSCR registers or is fixed to 1.0 when scaling is disabled:</p> <p>00 Invalid status, Counter not incrementing.</p> <p>01 CLK0 (REFCLK).</p> <p>10 CLK1 (FASTCLK).</p> <p>11 Invalid status, counter not incrementing.</p> <p>These bits are only valid when hardware clock switching is implemented (HWCLKSW=1).</p> <p>If HWCLKSW=0, these bits read a constant value of 0x01 regardless of the value of TSCLKSEL input and Counter increment value is used from CNTSCR0 or fixed to 1.0 depending on the status of Counter scaling feature.</p>

^c If CNTSC=0, CNTSCR is permanently driven to 0x0100_0000.

Table B-7 CNTID register bit assignments (continued)

Bits	Name	Access	Reset value	Function
[16]	CNTCS	RO	Defined by parameter with a default value of 0x1	Indicates whether Clock Switching is implemented: 0 HW-based Counter Clock Switching is not implemented. 1 HW-based Counter Clock Switching is implemented.
[15:4]	-	RAZ/WI	0x000	Reserved
[3:0]	CNTSC	RO	0x1	Indicates whether Counter Scaling is implemented: 0000 Counter Scaling is not implemented. 0001 Counter Scaling is implemented. All other values are Reserved.

Note

CNTCS and CNTSELSC are new fields that are defined in this implementation.

CNTSCR0, CNTSCR1, Counter Scaling registers

The CNTSCR0 and CNTSCR1 registers have the same field definitions as the CNTSCR register. These two extra registers are used to preprogram the scaling values so that when hardware-based clock switching is implemented there is no need to program the scaling increment value each time when clock is switched.

When read by software, the value read is the value that software has written. In certain cases, for example when CNTCR.SCEN has disabled scaling, the actual increment value that the Counter uses is 1.0. However, the value that is read from these registers does not reflect this. Therefore, the actual increment value that the Counter uses depends on the programming of these registers, the value of two HW configuration parameters, CNTSC and HWCLKSW, and the value of CNTCR.SCEN.

This implementation enables software to keep the scaling values in these registers unaffected when increment value changes due to Counter disabling.

These registers can only be written when the Counter is disabled (CNTCR.EN=0).

The following table shows the bit assignments.

Table B-8 CNTSCR* register bit assignments

Bits	Name	Access	Reset value	Function
[31:0]	ScaleVal	RW	0x0100_0000 ^d	When counter scaling is enabled, ScaleVal is the amount added to the Counter Count Value for every period of the counter as determined by 1/Frequency from the current operating frequency of the system counter, the <i>counter tick</i> . ScaleVal is expressed as an unsigned fixed-point number with an 8-bit integer value and a 24-bit fractional value. The CNTSCR register can only be changed when the counter is disabled, which CNTCR.EN=0. If the value of CTNSCR changes when CNTCR.EN==1, then the Counter Count Value becomes UNKNOWN and remains UNKNOWN on future ticks of the clock.

^d If CNTSC=0, CNTSCR* are permanently driven to 0x0100_0000.

If HWCLKSW= 0, CNTSCR1 is permanently driven to 0x0000_0000.

B.3 System Timer

The SSE-123 Example Subsystem contains a system counter.

This section contains the following subsections:

- [B.3.1 System Timer overview on page Appx-B-123.](#)
- [B.3.2 System Timer operation on page Appx-B-123.](#)
- [B.3.3 Programmers model on page Appx-B-124.](#)

B.3.1 System Timer overview

This section provides an overview of the System Timer.

The System Timer has the following features:

- Count up and count down timer functionality with *auto-increment* feature.
- Generation of a level triggered interrupt after a preconfigured period of time has passed.
- Time-based on shared system time count that the System Counter generates.

The following figure shows a block diagram of the System Timer.

Figure B-3 System Timer block diagram

B.3.2 System Timer operation

The primary function of the System Timer is to generate an interrupt output that is based on the Timer configuration and interrupt mask setting.

The timers can be programmed to count:

- Up to a threshold, by programming a CompareValue (CNTP_CVAL).
- Down from a programmed value, by programming a TimerValue (CNTP_TVAL).

The basic function of the System Timer is:

```
TimerCondMet = Counter[63:0] - CompareValue[63:0] >= 0
```

An alternative 32-bit view, called TimerValue, can be used to set the CompareValue as follows:

```
CompareValue = (Counter[63:0] + SignExtend(TimerValue)[63:0])
```

And reading the TimerValue gives the count down value:

```
TimerValue = (CompareValue[31:0] - Counter [31:0])
```

The *auto-increment* feature allows generation of Timer interrupt at regular intervals without the need for reprogramming the Timer after each interrupt and re-enabling the timer logic.

The Automatic Increment timer view operates as a 64-bit up-counter. An AutoIncrValue Reload register is programmed with a 32-bit offset.

If the EN bit of the AutoIncrValue Control register is set, the offset value is zero-extended, summed with the count value, and loaded into the AutoIncrValue register, performed automatically by hardware.

The operation of *auto-increment* is as follows:

```
AutoIncrValue = (ZeroExtend(Reload[31:0])[63:0] + Counter[63:0])
```

Where:

AutoIncrValue	The value of the AutoIncrValue register.
Reload	The value of the AutoIncrValue Reload register.
Counter	The value of the Count register.

The timer condition is met when the count value reaches the value that is loaded into its AutoIncrValue register:

```
TimerCondMet = (((Counter[63:0] - AutoIncrValue[63:0]) >= 0)
```

Where:

TimerCondMet TRUE	If the timer condition is met.
TimerCondMet FALSE	Otherwise.

When the timer condition is met:

- An interrupt is generated, if the interrupt is not masked in the timer control register, and remains asserted until software clears it by writing to the CLR bit of the AutoIncrValue Control register, CNTP_AIVAL_CTL).
- The CLR bit in the AutoIncrValue Control register is set to 1 and it remains 1 until software clears it by writing '0'.
- The AutoIncrValue register is reloaded with the new value.

When the *auto-increment* feature is enabled, the operation of normal timer, using the compare value or timer value registers, is disabled. This is to ensure that when the interrupt is generated, the cause of interrupt is unambiguous to the user.

The auto-increment timer starts counting only when both the Timer is enabled (CNTP_CTL.ENABLE=1) and *auto-increment* mode is enabled by setting CNTP_AIVAL_CTL.EN=1. When both are enabled, the Timer starts counting down until the AIVAL_RELOAD period is reached.

B.3.3 Programmers model

The registers of the System Timer are grouped into a single 4KB block that is called the CNTBase frame. The base address of the CNTBase frame is not defined here and is IMPLEMENTATION DEFINED.

See [Chapter 3 Programmers model on page 3-40](#) for the base addresses of these registers in the SSE-123 Subsystem.

CNTBase Registers Summary

This section provides a summary of the CNTBase Registers.

The following table shows a summary of the CNTBase Registers.

Table B-9 CNTBase Frame Registers summary

Offset	Name	Access	Reset value	Description
0x000	CNTPCT[31:0]	RO	0xFFFF_XXXX	Physical Count Register. See <i>CNTPCT</i> , <i>Counter-timer Physical Count register</i> on page Appx-B-126.
0x004	CNTPCT[63:32]	RO	0xFFFF_XXXX	
0x008-0x00C	-	-	-	Reserved.
0x010	CNTPFRQ ^e	RW	0x0000_0000	Counter Frequency register. See <i>CNTPFRQ</i> , <i>Counter-timer Frequency register</i> on page Appx-B-126.
0x014-0x01C	-	-	-	Reserved.
0x020	CNTP_CVAL[31:0]	RW	0x0000_0000	Timer CompareValue register. See <i>CNTP_CVAL</i> , <i>Counter-timer Physical Timer CompareValue register</i> on page Appx-B-126.
0x024	CNTP_CVAL[63:32]	RW	0x0000_0000	
0x028	CNTP_TVAL	RW	0xFFFF_XXXX	TimerValue register. See <i>CNTP_TVAL</i> , <i>Counter-timer Physical Timer TimerValue register</i> on page Appx-B-126.
0x02C	CNTP_CTL	RW	0x0000_000X	Timer Control register. See <i>CNTP_CTL</i> , <i>Counter-timer Physical Timer Control register</i> on page Appx-B-127.
0x030-0x03C	-	-	-	Reserved.
0x040	CNTP_AIVAL[31:0]	RO	0xFFFF_XXXX	AutoIncrValue register. See <i>CNTP_AIVAL</i> , <i>AutoIncrValue register</i> on page Appx-B-128.
0x044	CNTP_AIVAL[63:32]	RO	0xFFFF_XXXX	
0x048	CNTP_AIVAL_RELOAD	RW	0xFFFF_XXXX	AutoIncrValue Reload register. See <i>CNTP_AIVAL_RELOAD</i> , <i>AutoIncrValue Reload register</i> on page Appx-B-128.
0x04C	CNTP_AIVAL_CTL	RW	0xFFFF_XXXX	AutoIncrValue Control register. See <i>CNTP_AIVAL_CTL</i> , <i>AutoIncrValue Control register</i> on page Appx-B-128.
0x050	CNTP_CFG	RO	0x0000_0001	Timer Configuration register. See <i>CNTP_CFG</i> , <i>Configuration register</i> on page Appx-B-129.
0x054-0xFCC	-	-	-	Reserved.
0xFD0	CNTP_PID4	RO	0x0000_0004	Peripheral ID4.
0xFD4-0xFDC	-	RO	-	Reserved.
0xFE0	CNTP_PID0	RO	0x0000_00B7	Peripheral ID0.
0xFE4	CNTP_PID1	RO	0x0000_00B0	Peripheral ID1.
0xFE8	CNTP_PID2	RO	0x0000_000B	Peripheral ID2.
0xFEC	CNTP_PID3	RO	0x0000_0000	Peripheral ID3.
0xFF0	CNTP_CID0	RO	0x0000_000D	Component ID0.
0xFF4	CNTP_CID1	RO	0x0000_00F0	Component ID1.
0xFF8	CNTP_CID2	RO	0x0000_0005	Component ID2.
0xFFC	CNTP_CID3	RO	0x0000_00B1	Component ID3.

Register descriptions

This section describes each of the System Timer registers.

^e The ARMv8-A defines the CNTPFRQ register to enable software to discover the frequency of Timer clock. This register is included for software-compatibility but is not used in this implementation where the Counter can have hardware-switchable clocks.

CNTPCT, Counter-timer Physical Count register

The CNTPCT register holds the 64-bit physical count value.

The following table shows the bit assignments.

Table B-10 CNTPCT register bit assignments

Bits	Name	Access	Reset value	Function
[63:0]	CountValue	RO	0xFFFF_FFFF_FFFF_FFFF	Physical count value.

CNTRQ, Counter-timer Frequency register

The CNTRQ register is provided so that software can discover the frequency of the system counter. The instance of this register in the CNTCTLBase frame must be programmed with this value as part of system initialization. Hardware does not interpret the value of the register.

The following table shows the bit assignments.

Table B-11 CNTRQ register bit assignments

Bits	Name	Access	Reset value	Function
[31:0]	ClockFrequency	RW	0x0000_0000	Clock frequency.

CNTP_CVAL, Counter-timer Physical Timer CompareValue register

The CNTP_CVAL register holds the 64-bit compare value for the timer.

The following table shows the bit assignments.

Table B-12 CNTP_CVAL register bit assignments

Bits	Name	Access	Reset value	Function
[63:0]	CompareValue	RW	0x0000_0000_0000_0000	<p>Holds the 64-bit compare value for the timer.</p> <p>When CNTP_CTL.ENABLE is 1, the timer condition is met when (CNTPCT - CompareValue) is greater than zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:</p> <ul style="list-style-type: none"> • CNTP_CTL.ISTATUS is set to 1. • An interrupt is generated if CNTP_CTL.IMASK is 0. <p>When CNTP_CTL.ENABLE is 0, the timer condition is not met, but CNTPCT continues to count.</p>

CNTP_TVAL, Counter-timer Physical Timer TimerValue register

The CNTP_TVAL register holds the timer value for the timer.

The following table shows the bit assignments.

Table B-13 CNTP_TVAL register bit assignments

Bits	Name	Access	Reset value	Function
[31:0]	TimerValue	RW	0xFFFF_FFFF	<p>The TimerValue view of the physical timer.</p> <p>On a read of this register:</p> <ul style="list-style-type: none"> If CNTP_CTL.ENABLE is 0, the value that is returned is UNKNOWN. If CNTP_CTL.ENABLE is 1, the value that is returned is (CNTP_CVAL - CNTPCT). <p>On a write of this register, CNTP_CVAL is set to (CNTPCT + TimerValue), where TimerValue is treated as a signed 32-bit integer.</p> <p>When CNTP_CTL.ENABLE is 1, the timer condition is met when (CNTPCT - CNTP_CVAL) is greater than zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:</p> <ul style="list-style-type: none"> CNTP_CTL.ISTATUS is set to 1. If CNTP_CTL.IMASK is 0, an interrupt is generated. <p>When CNTP_CTL.ENABLE is 0, the timer condition is not met, but CNTPCT continues to count, so the TimerValue view appears to continue to count down.</p>

CNTP_CTL, Counter-timer Physical Timer Control register

The CNTP_CTL register is a control register for the timer.

The following table shows the bit assignments.

Table B-14 CNTP_CTL register bit assignments

Bits	Name	Access	Reset value	Function
[31:3]	-	RAZ/WI	-	Reserved.
[2]	ISTATUS	RO	0xX	<p>The status of the timer. This bit indicates whether the timer condition is met:</p> <p>0 Timer condition is not met.</p> <p>1 Timer condition is met.</p> <p>When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met.</p> <p>ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0, then the timer interrupt is asserted.</p> <p>When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.</p>

Table B-14 CNTP_CTL register bit assignments (continued)

Bits	Name	Access	Reset value	Function
[1]	IMASK	RW	0xX	<p>Timer interrupt mask bit. Permitted values are:</p> <p>0 The IMASK bit masks the Timer interrupt.</p> <p>1 The IMASK bit masks the Timer interrupt.</p> <p>For more information, see the description of the ISTATUS bit.</p>
[0]	ENABLE	RW	0x0	<p>Enables the timer. Permitted values are:</p> <p>0 Timer is disabled.</p> <p>1 Timer is enabled.</p> <p>Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTP_TVAL continues to count down.</p> <p>Disabling the output signal might be a power-saving option.</p>

CNTP_AIVAL, AutoIncrValue register

The CNTP_AIVAL register holds the 64-bit Automatic Increment value for the timer.

The following table shows the bit assignments.

Table B-15 CNTP_AIVAL register bit assignments

Bits	Name	Access	Width	Reset value	Description
[63:0]	AutoIncrValue timer value	RO	64	0x0000_0000_0000_0000	Timer AutoIncrValue.

CNTP_AIVAL_RELOAD, AutoIncrValue Reload register

Holds the programmable offset value for the Automatic Increment timer view.

The following table shows the bit assignments.

Table B-16 CNTP_AIVAL_RELOAD register bit assignments

Bits	Name	Access	Width	Reset value	Description
[31:0]	AutoIncrValue Reload value	RW	32	0x0000_0000_0000_0000	Timer AutoIncrValue Reload.

CNTP_AIVAL_CTL, AutoIncrValue Control register

Control register for the Automatic Increment timer view.

The following table shows the bit assignments.

Table B-17 CNTP_AIVAL_CTL register bit assignments

Bits	Name	Access	Width	Reset value	Description
[31:2]	--	-	30	-	Reserved.
[1]	CLR	WO	1	0xX	<p>Timer interrupt clear bit. This bit is only used to clear the interrupt that is generated because of auto-increment mode. For clearing the interrupt generated by normal mode, the Timer should be disabled.</p> <p>Permitted values are:</p> <ul style="list-style-type: none"> • Timer interrupt is clear. • Timer interrupt is not clear. <p>The CLR bit can only be written to as zero. Writes as one are ignored.</p>
[0]	EN	WO	1	0xX	<p>Enables the AutoIncrValue register. Permitted values are:</p> <ul style="list-style-type: none"> • AutoIncrValue disabled. • AutoIncrValue enabled.

CNTP_CFG, Configuration register

Provides timer configuration information.

The following table shows the bit assignments.

Table B-18 CNTP_CFG register bit assignments

Bits	Name	Access	Width	Reset value	Description
[31:4]	-	-	28	-	Reserved.
[3:0]	AIVAL	RO	4	0x1	<p>Indicates whether Automatic Increment is implemented. Permitted values are:</p> <p>0000 Automatic Increment is not implemented.</p> <p>0001 Automatic Increment is implemented.</p> <p>All other values are Reserved.</p>

B.4 System Watchdog

The System Watchdog aids the detection of errant system behavior. If the System Watchdog is not refreshed periodically, it raises a signal, that is typically wired to an interrupt. If this watchdog remains unrefreshed, it raises a second signal that can be used to interrupt higher-privileged software or cause a reset.

This section contains the following subsections:

- [B.4.1 System Watchdog overview on page Appx-B-130.](#)
- [B.4.2 Watchdog operation on page Appx-B-130.](#)
- [B.4.3 Programmers model on page Appx-B-130.](#)

B.4.1 System Watchdog overview

This section provides an overview of the System Watchdog.

The following figure shows a block diagram of the System Watchdog.

Figure B-4 Block diagram of the System Watchdog

B.4.2 Watchdog operation

The basic function of the Generic Watchdog is to count for a fixed period of time, during which it expects to be refreshed by the system, indicating normal operation.

If a refresh occurs within the watch period, the period is refreshed to the start.

If the refresh does not occur, then the watch period expires, and a signal **INTR[0]** is raised, and a second watch period is begun.

The initial signal is typically wired to an interrupt and alerts the system. The system can attempt to take corrective action that includes refreshing the watchdog within the second watch period. If the refresh is successful, the system returns to the previous normal operation.

If it fails, then the second watch period expires, and a second signal **INTR[1]** is generated. The signal is fed to higher privileged software as an interrupt or reset for it to take executive action.

The Watchdog uses the input time **TSVALUEB** generated by the System Counter as the timebase against which the decision to trigger an interrupt is made.

B.4.3 Programmers model

This section describes the programmers model of the System Watchdog.

The Watchdog includes the following two 4KB register frames:

- Control Frame.
- Refresh Frame.

Configurable parameters control the base addresses of Control and Refresh frames. These parameters provide the flexibility of arranging these two frames within an 8KB memory map that the following table shows. See [Chapter 3 Programmers model on page 3-40](#) for the base addresses of these registers in SSE-123 Subsystem.

The following table shows the Base addresses of Control and Refresh frames.

Table B-19 Base addresses of Control and Refresh frames

Description	Start address	End address	Size
Control Frame	0x0_0000	0x0_0FFF	4KB
Refresh Frame	0x0_1000	0x0_1FFF	4KB

Control Frame registers summary

This section provides a summary of the Control Frame registers.

The following table shows the Control Frame registers summary.

Table B-20 Control Frame registers summary

Offset	Name	Access	Reset value	Description
0x000	WCS	RW	0x0000_0000	WCS, Watchdog Control and Status register on page Appx-B-132
0x004	-	RES0	-	Reserved.
0x008	WOR	RW	0x0000_0000	WOR, Watchdog Offset register on page Appx-B-132.
0x00c	-	RES0	-	Reserved.
0x010	WCV[31:0]	RW	0x0000_0000	WCV, Watchdog Compare Value register on page Appx-B-132
0x014	WCV[63:32]	RW	0x0000_0000	-
0x018-0xFC8	-	RES0	-	Reserved.
0xFCC	W_IIDR	RO	0x0000_143B	W_IIDR, Watchdog Interface Identification register on page Appx-B-132
0xFD0-0xFFC	-	RO	-	Reserved.

Refresh Frame registers Summary

This section provides a summary of the Refresh Frame registers.

The following table shows a summary of the Refresh Frame registers.

Table B-21 Refresh Frame registers summary

Offset	Name	Access	Reset value	Description
0x000	WRR	RW	0x0000_0000	WRR, Watchdog Refresh register on page Appx-B-133.
0x004-0xFC8	-	-	-	Reserved.
0xFCC	W_IIDR	RO	0x0000_143B	W_IIDR, Watchdog Interface Identification register on page Appx-B-132.
0xFD0-0xFFC	-	RO	-	Reserved.

Register descriptions

This section describes each System Watchdog register.

All registers are 32-bit and must be accessed using 32-bit reads and writes.

WCS, Watchdog Control and Status register

The WCS register is a control and status register for the watchdog. Any write to this register causes an explicit watchdog refresh.

The following table shows the bit assignments.

Table B-22 WCS register bit assignments

Bits	Name	Access	Reset value	Function
[31:3]	-	RAZ/WI	-	Reserved.
[2:1]	Watchdog Signal Status	RO	0x0	Indicates the current state of the watchdog signals: Bit 0 WS0 Interrupt INTR[0]. Bit 1 WS1 Interrupt INTR[1].
[0]	Watchdog Enable	RW	0x0	Watchdog enable: 0 A write of 0 disables the Watchdog. 1 A write of 1 to this bit enables the Watchdog. A read of these bits indicates the current state of the Watchdog enable.

WOR, Watchdog Offset register

The WOR register is a countdown timer value for the watchdog. Any write to this register causes an explicit watchdog refresh.

The following table shows the bit assignments.

Table B-23 WOR register bit assignments

Bits	Name	Access	Reset value	Function
[31:0]	WOR	RW	0x0000_0000	Holds the 32-bit countdown timer value.

WCV, Watchdog Compare Value register

The WCV register holds the compare value of the watchdog.

The following table shows the bit assignments.

Table B-24 WCV register bit assignments

Bits	Name	Access	Reset value	Function
[63:0]	WCV	RW	0x0000_0000	Holds the current 64-bit compare value.

W_IIDR, Watchdog Interface Identification register

The W_IIDR register is an identification register for the watchdog.

The following table shows the bit assignments.

Table B-25 W_IIDR register bit assignments

Bits	Name	Access	Reset value	Function
[31:24]	ID	RO	0x00	Product identifier. 0x00 = System Watchdog.
[23:20]	-	RO	0x0	Reserved.
[19:16]	ARCH	RO	0x0	Architecture version, v0.
[15:12]	REV	RO	0x1	Revision number for the component. 0x1 = r0p1
[11:0]	JEPCODE	RO	0x43B	Arm JEP106 code.

WRR, Watchdog Refresh register

The WRR register is a refresh register for the Watchdog. Any write to this register causes an explicit watchdog refresh.

The following table shows the bit assignments.

Table B-26 WRR register bit assignments

Bits	Name	Access	Function
[31:0]	WRR	RW	A write to this location causes the Watchdog to refresh and start a new watch period. A read has no effect and returns 0.

Appendix C

Revisions

This appendix describes the technical changes between released issues of this book.

It contains the following section:
